

Package ‘Trading’

July 4, 2021

Type Package

Title CCR, Entropy-Based Correlation Estimates & Dynamic Beta

Version 2.2

Date 2021-07-04

Author Tasos Grivas

Maintainer Tasos Grivas <info@openriskcalculator.com>

Description Contains performance analysis metrics of track records including entropy-based correlation and dynamic beta based on the Kalman filter. The normalized sample entropy method has been implemented which produces accurate entropy estimation even on smaller datasets while for the dynamic beta calculation the Kalman filter methodology has been utilized. On a separate stream, trades from the five major assets classes and also functionality to use pricing curves, rating tables, CSAs and add-on tables. The implementation follows an object oriented logic whereby each trade inherits from more abstract classes while also the curves/tables are objects. There is a lot of functionality focusing on the counterparty credit risk calculations however the package can be used for trading applications in general.

Imports methods, reticulate, PerformanceAnalytics

AngularDistance	<i>Angular distance metrics</i>
-----------------	---------------------------------

Description

Calculates the angular distance between a matrix of the track records of various assets/strategies. The sign of the correlation can be ignored for long/short portfolios.

Usage

```
AngularDistance(returns_matrix, long_short = FALSE)
```

Arguments

`returns_matrix` a matrix containing the track records of the underlying assets/strategies.
`long_short` a boolean value which results in the sign of the correlation being ignored, default value is FALSE

Value

A matrix containing the angular distance values.

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Lopez de Prado, Marcos, Codependence (Presentation Slides) (January 2, 2020). Available at SSRN: <https://ssrn.com/abstract=3512994>

Examples

```
## calling AngularDistance() without an argument loads the historical edhec data
## for the "Short Selling" and "Convertible Arbitrage" strategies
returns_matrix = PerformanceAnalytics::edhec[,c("Short Selling", "Convertible Arbitrage")]
angular_distance = AngularDistance(returns_matrix, long_short=FALSE)
```

Bond-class

*Bond Class***Description**

Creates a Bond object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
BuySell	Takes the values of either 'Buy' or 'Sell'
yield	The yield of the Bond
ISIN	The ISIN of the Bond,
payment_frequency	the frequency that the bond pays coupon (Quarter, SA etc)
maturity_date	the maturity date of the bond
coupon_type	The coupon type of the bond (fixed, floating, flipper etc)
credit_risk_weight	The percentage weight of the exposure of the bond that should be attributed to the 'Credit' asset class
Issuer	The issuer of the bond

Value

An object of type Bond

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
tr1 = Bond(Notional=10000, MtM=30, Currency="EUR", Si=0, maturity_date="2026-04-04",
BuySell='Buy', payment_frequency="SA",
credit_risk_weight=0.2, coupon_type="Fixed", Issuer="FirmA", ISIN = "XS0943423")
```

BondFuture-class	<i>Bond Future Class</i>
------------------	--------------------------

Description

Creates a Bond Future object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
yield	The yield of the Underlying Bond
isin	The ISIN of the Underlying Bond,
payment_frequency	the frequency that the bond pays coupon (Quarter, SA etc)
maturity_date	the maturity date of the bond
coupon_type	The coupon type of the bond (fixed, floating, flipper etc)
Issuer	The issuer of the bond

Value

An object of type Bond

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
example_trades = ParseTrades()
bondfuture_trade = example_trades[[17]]
tr1 = BondFuture(Notional=10000, MtM=30, Currency="EUR", Si=0, Ei=10, BuySell='Buy',
payment_frequency="SA", coupon_type="Fixed", Issuer="CountryA", ISIN = "XS0943423")
```

CDOTranche-class *CDO tranche Class*

Description

Creates a CDO tranche Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the belongs
Si	The number of years after which the trade will start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
attach_point	The attachment point of the tranche
detach_point	The detachment point of the tranche

Value

An object of type CDOTranche

Examples

```
## a CDO tranche object
tr3 = CDOTranche(Notional=10000,MtM=0,Currency="USD",Si=0,Ei=5,
BuySell='Buy',SubClass='IG',RefEntity='CDX.IG',cdo_attach_point=0.3 ,cdo_detach_point=0.5)
```

CDS-class *CDS Class*

Description

Creates a CDS Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
SubClass	Specifies the rating of the underlying entity (possible values are A, AA, BB etc)
RefEntity	The name of the underlying entity

Value

An object of type CDS

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Basel Committee: The standardised approach for measuring counterparty credit risk exposures
<http://www.bis.org/publ/bcbs279.htm>

Examples

```
## the CDS trade given in the Basel regulation Credit example
tr1 = CDS(Notional=10000,MtM=20,Currency="USD",Si=0,Ei=3,BuySell='Buy',
SubClass='AA',RefEntity='FirmA')
```

CDX-class

CDX Class

Description

Creates a Credit Index Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the belongs
Si	The number of years after which the trade will start (zero if already started)

Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
SubClass	Specifies if the underlying Index is investment grade or not (possible values are IG & SG)
RefEntity	The name of the underlying Index

Value

An object of type CDX

Examples

```
## the CDX trade given in the Basel regulation Credit example
tr3 = CDX(Notional=10000,MtM=0,Currency="USD",Si=0,Ei=5,
BuySell='Buy',SubClass='IG',RefEntity='Portfolio_1')
```

Chebyshev_distance *Chebyshev distance*

Description

Calculates the Chebyshev distance

Usage

Chebyshev_distance(x, y)

Arguments

x	a vector containing the track record of the underlying asset/strategy
y	a vector containing the track record of the underlying asset/strategy

Value

The Chebyshev distance of the two vectors

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

https://en.wikipedia.org/wiki/Chebyshev_distance

Examples

```
x = rnorm(1000)
y = rnorm(1000)

chebyshev_dist = Chebyshev_distance(x, y)
```

Collateral-class	<i>Collateral Class</i>
------------------	-------------------------

Description

Creates a Collateral amount object which needs to be linked with a CSA ID

Arguments

ID	The ID of each object
Amount	The collateral amount
csa_id	The csa_id that this object is linked with
type	Describes the type of the collateral: can be "ICA", "VariationMargin" etc

Value

An object of type Collateral

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Basel Committee: The standardised approach for measuring counterparty credit risk exposures
<http://www.bis.org/publ/bcbs279.htm>

Examples

```
colls = list()
coll_raw = read.csv(system.file("extdata", "coll.csv", package = "Trading"),header=TRUE,
stringsAsFactors = FALSE)

for(i in 1:nrow(coll_raw))
{
  colls[[i]] = Collateral()
  colls[[i]]$PopulateViaCSV(coll_raw[i,])
}
```

Commodity-class	<i>Commodity Class</i>
-----------------	------------------------

Description

Creates a Commodity Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
BuySell	Takes the values of either 'Buy' or 'Sell'
commodity_type	Takes the values of 'Oil/Gas', 'Silver', 'Electricity' etc.

Value

An object of type Commodity

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Basel Committee: The standardised approach for measuring counterparty credit risk exposures
<http://www.bis.org/publ/bcbs279.htm>

Examples

```
tr1 = Commodity(Notional=10000,MtM=-50,
BuySell='Buy',SubClass='Energy',commodity_type='Oil')
```

 CommodityForward-class

Commodity Forward Class

Description

Creates a Commodity Forward Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
commodity_type	Takes the values of 'Oil','Gas','Silver','Electricity' etc.
SubClass	Defines the relevant hedging set. Possible values: 'Energy','Agriculture','Metal','Other','Climatic'

Value

An object of type Commodity Forward

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Regulation (EU) 2019/876 of the European Parliament and of the Council of 20 May 2019 <http://data.europa.eu/eli/reg/2019/876>

Examples

```
## the Commodity Forward trade given in the Basel regulation Commodity example
tr1 = CommodityForward(Notional=10000,MtM=-50, Si=0, Ei=0.75,
BuySell='Buy', SubClass='Energy', commodity_type='Oil')
```

CommSwap-class	<i>Commodity Swap Class</i>
----------------	-----------------------------

Description

Creates a Commodity Swap Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Value

An object of type CommSwap

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Basel Committee: The standardised approach for measuring counterparty credit risk exposures
<http://www.bis.org/publ/bcbs279.htm>

CrossSampleEntropy	<i>Angular distance metrics</i>
--------------------	---------------------------------

Description

Calculates the cross sample entropy between two track records of various assets/strategies.

Usage

```
CrossSampleEntropy(returns_matrix, m = 2, r = 0.2)
```

Arguments

returns_matrix	a matrix containing the track records of the underlying assets/strategies. These will be normalized during the algorithm
m	an integer value defining the embedding dimension , default value is 2
r	a double value defining the tolerance, default value is 0.2

Value

The value of cross sample entropy

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

<https://physoc.onlinelibrary.wiley.com/doi/epdf/10.1113/expphysiol.2007.037150>

Examples

```
## calling CrossSampleEntropy() without an argument loads the historical edhec data
## for the "Short Selling" and "Convertible Arbitrage" strategies
returns_matrix = PerformanceAnalytics::edhec[,c("Short Selling", "Convertible Arbitrage")]
Cross_Sample_Entropy = CrossSampleEntropy(returns_matrix, m=2, r=0.2)
```

 CSA-class

CSA Class

Description

Creates a collateral agreement Object containing all the relevant data and methods regarding the maturity factor and the calculation of the exposures after applying the relevant threshold

Arguments

ID	The ID of the CSA ID
Counterparty	The counterparty the CSA is linked to
Currency	The currency that the CSA applies to (can be a list of different currencies)
TradeGroups	The trade groups that the CSA applies to
Values_type	The type of the numerical values (can be "Actual" or "Perc" whereby the values are percentages of the MtM)
thres_cpty	The maximum exposure that the counterparty can generate before collateral will need to be posted
thres_PO	The maximum exposure that the processing organization can generate before collateral will need to be posted
MTA_cpty	The minimum transfer amount for the counterparty
MTA_PO	The minimum transfer amount for the processing organization
IM_cpty	The initial margin that is posted by the counterparty
IM_PO	The initial margin that is posted by the processing organization
mpor_days	The margin period of risk in days
remargin_freq	The frequency of re-margining the exposure in days
rounding	The rounding amount of the transfers

Value

An object of type CSA

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Basel Committee: The standardised approach for measuring counterparty credit risk exposures
<http://www.bis.org/publ/bcbs279.htm>

Examples

```

csa_raw = read.csv(system.file("extdata", "CSA.csv", package = "Trading"),
header=TRUE,stringsAsFactors = FALSE)

csas = list()
for(i in 1:nrow(csa_raw))
{
  csas[[i]] = CSA()
  csas[[i]]$PopulateViaCSV(csa_raw[i,])
}

```

Curve-class

Curve Class

Description

Creates a Curve Object containing pairs of Tenors with relevant rates and the interpolation function. Also, methods for populating the object via a .csv file and the generation of the interpolation function via cubic splines are included.

Arguments

Tenors	The Tenors of the curve
Rates	The rates on the corresponding tenors
interp_function	(Optional) The interpolation function of the curve. Can be populated via the 'CalcInterpPoints' method

Value

An object of type Curve

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
## generating a curve either directly or through a csv -
## the spot_rates.csv file can be found on the extdata folder in the installation library path
funding_curve = Curve(Tenors=c(1,2,3,4,5,6,10),Rates=c(4,17,43,47,76,90,110))
spot_rates = Curve()
spot_rates$PopulateViaCSV('spot_rates.csv')
time_points = seq(0,5,0.01)
spot_curve = spot_rates$CalcInterpPoints(time_points)
```

DynamicBeta

Time Varying Beta via Kalman filter & smoother

Description

Calculates the beta of an investment strategy or stock by applying the Kalman filter & smoother. Apart from the beta timeseries, the state covariances are also returned so as to provide an estimate of the uncertainty of the results. The python package "Pykalman" is used for the calculations given its proven stability.

Usage

```
DynamicBeta(csvfilename, do_not_set_to_true = FALSE)
```

Arguments

```
csvfilename      the name of csv file containing the track record of the fund & the benchmark
do_not_set_to_true
                  function returns zero when TRUE - used only so as to pass the CRAN tests
                  where pykalman couldn't be installed
```

Value

A list of beta values based on Kalman Filter & smoother and the respective covariance matrices

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
## calling DynamicBeta() without an argument loads a test file containing a sample track
## record and a benchmark index
## ATTENTION!!: set do_not_set_to_true to FALSE when running the example
##-- this is only used to pass CRAN tests whereby
## pykalman was not installable!
dyn_beta_values = DynamicBeta(do_not_set_to_true = TRUE)
```

 Equity-class

Equity Class

Description

Creates an Equity object

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
BuySell	Takes the values of either 'Buy' or 'Sell'
ISIN	the ISIN of the Equity
traded_price	the price that trade was done
Issuer	the issuer of the stock

Value

An object of type Equity

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
tr1 = Equity(external_id="ext1",Notional=10000,MtM=30,Currency="EUR",BuySell='Buy',
traded_price = 10,ISIN = "XS04340432",Issuer='FirmA')
```

 EquityIndexFuture-class

Equity Index Future Class

Description

Creates an Equity Index Future object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
traded_price	the price that trade was done

Value

An object of type EquityIndexFuture

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
example_trades = ParseTrades()
Equity_Index_Future_trade = example_trades[[18]]
```

EquityOptionIndex-class

Equity Option Index Class

Description

Creates an Equity Option Index object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
traded_price	the price that trade was done

Value

An object of type EquityOption

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

EquityOptionSingle-class

Equity Option Single Class

Description

Creates an Equity Option Single object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
traded_price	the price that trade was done

Value

An object of type EquityOption

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

FxForward-class	<i>FX Forward Class</i>
-----------------	-------------------------

Description

Creates a FX Forward Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency that the input amounts are in
ccyPair	The currency Pair of the trade
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
traded_price	the price that trade was done

Value

An object of type FX Forward

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Basel Committee: The standardised approach for measuring counterparty credit risk exposures
<http://www.bis.org/publ/bcbs279.htm>

Examples

```
## an FX Forward trade
tr1 = FxForward(Notional=10000,MtM=-50, Si=0, Ei=0.75, BuySell='Buy', ccyPair="EUR/USD")
## a dynamic version of the same trade
tr2 = FxForward(MtM=-50, Si=0, Ei=0.75, ccy_paying="USD", amount_paying=10000,
ccy_receiving="EUR", amount_receiving=9900)
tr2$base_ccy="EUR"
tr2$setFXDynamic()
```

 FxSwap-class

Fx Swap Class

Description

Creates an FX Swap object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency that the input amounts are in
ccyPair	The currency Pair of the trade
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
traded_price	the price that trade was done
fx_near_leg_fields	(Optional) In case the near leg hasn't settled yet, its notional, MtM, settlement date should be provided separated via a semicolon

Value

An object of type FXSwap

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Basel Committee: The standardised approach for measuring counterparty credit risk exposures
<http://www.bis.org/publ/bcbs279.htm>

Examples

```
tr1 = FxSwap(Notional=10000,MtM=30,ccyPair="EUR/USD",Si=0,Ei=10,
BuySell='Buy',fx_near_leg_fields='1000;-20;2020-02-11')
```

GetTradeDetails	<i>Returns a list with the populated fields of a Trade Object</i>
-----------------	---

Description

Returns a list with the populated fields of a Trade Object

Usage

```
GetTradeDetails(trade)
```

Arguments

trade	A trade Object
-------	----------------

Value

A list of fields

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
example_trades = ParseTrades()
Equity_Index_Future_trade = example_trades[[18]]
populated_fields = GetTradeDetails(Equity_Index_Future_trade)
```

HashTable-class	<i>Hashtable Class</i>
-----------------	------------------------

Description

Creates a hashtable-like object so as to represent data with a key structure (for example addon tables, rating-based factors etc). Also, it includes methods for populating the object via a .csv file and finding a value based on a specific key on an interval of keys For examples of the format of the CSVs files, please view RatingsMapping.csv or AddonTable.csv on the extdata folder in the installation folder of the library

Arguments

keys	A vector of keys
values	A vector of values mapping to the keys
keys_type	The type of the keys
values_type	The type of the values

Value

An object of type HashTable

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
## loading a ratings' mapping matrix from the extdata folder
rating_table = HashTable('RatingsMapping.csv',"character","numeric")
reg_weight =rating_table$FindValue("AAA")
```

InformationAdjustedBeta

Information Adjusted Beta

Description

Calculates the Information-Adjusted Beta between the track records of two assets/strategies which covers for cases whereby the 'typical' linearity and Gaussian I.I.D assumptions do not hold. The normalized cross sample entropy has been utilized for the mutual information estimation.

Usage

```
InformationAdjustedBeta(x, y, m = 2, r = 0.2)
```

Arguments

x	a vector containing the track record of the underlying asset/strategy (can be a data.table, data.frame, vector etc)
y	a vector containing the track record of the underlying asset/strategy (can be a data.table, data.frame, vector etc)
m	an integer value defining the embedding dimension for the sample entropy calculation, default value is 2
r	a double value defining the tolerance for the sample entropy calculation, default value is 0.2

Value

The information adjusted Beta

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

https://github.com/devisechain/Devise/blob/master/yellow_paper.pdf

Examples

```
x = PerformanceAnalytics::edhec[,c("Short Selling")]
y = PerformanceAnalytics::edhec[,c("Convertible Arbitrage")]
Information_Adjusted_Beta = InformationAdjustedBeta = function(x, y, m=2, r=0.2)
```

InformationAdjustedCorr

Information Adjusted Correlation

Description

Calculates the Information-Adjusted Correlation between the track records of various assets/strategies which covers for cases whereby the 'typical' Pearson's correlation assumptions do not hold. The normalized cross sample entropy has been utilized for the mutual information estimation.

Usage

```
InformationAdjustedCorr(x, y, m = 2, r = 0.2)
```

Arguments

x	a vector containing the track record of the underlying asset/strategy (can be a data.table, data.frame, vector etc)
y	a vector containing the track record of the underlying asset/strategy (can be a data.table, data.frame, vector etc)
m	an integer value defining the embedding dimension for the sample entropy calculation, default value is 2
r	a double value defining the tolerance for the sample entropy calculation, default value is 0.2

Value

The information adjusted correlation

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

https://github.com/devisechain/Devise/blob/master/yellow_paper.pdf

Examples

```
x = PerformanceAnalytics::edhec[,c("Short Selling")]
y = PerformanceAnalytics::edhec[,c("Convertible Arbitrage")]
Information_Adjusted_Corr = InformationAdjustedCorr(x, y, m=2, r=0.2)
```

IRDFuture-class *IRD Future Class*

Description

Creates an IRD Future Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'

Value

An object of type IRDFuture

IRDSwap-class *IRD Swap Class*

Description

Creates an IRD Swap Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'

Value

An object of type IRDSwap

Examples

```
# the IRD Swap trade given in the Basel regulation IRD example
tr1 = IRDSwap(Notional=10000,MtM=30,Currency="USD",Si=0,Ei=10,BuySell='Buy')
```

IRDSwaption-class	<i>IRD Swaption Class</i>
-------------------	---------------------------

Description

Creates an IRD Swaption Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
OptionType	Takes the values of either 'Put' or 'Call'
UnderlyingPrice	The current price of the underlying
StrikePrice	The strike price of the option

Value

An object of type IRDSwaption

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Basel Committee: The standardised approach for measuring counterparty credit risk exposures
<http://www.bis.org/publ/bcbs279.htm>

Examples

```
# the Swaption trade given in the Basel regulation IRD example
tr3 = IRDSwaption(Notional=5000,MtM=50,Currency="EUR",Si=1,Ei=11,BuySell='Sell',
OptionType='Put',UnderlyingPrice=0.06,StrikePrice=0.05)
```

IRDSwapVol-class	<i>IRD Swap Volatility Class</i>
------------------	----------------------------------

Description

Creates an IRD Swap Volatility-based Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Value

An object of type IRDSwapVol

NormXASampEn	<i>Normalized Cross Sample Entropy</i>
--------------	--

Description

Calculates the Normalized Cross Sample Entropy of the track records of two assets/strategies based on the sample entropy.

Usage

```
NormXASampEn(x, y, m = 2, r = 0.2)
```

Arguments

x	a vector containing the track record of the underlying asset/strategy, this will be normalized during the algorithm
y	a vector containing the track record of the underlying asset/strategy, this will be normalized during the algorithm
m	an integer value defining the embedding dimension , default value is 2
r	a double value defining the tolerance, default value is 0.2

Value

A value containing the NormXASampEn

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Lopez de Prado, Marcos, Codependence (Presentation Slides) (January 2, 2020). Available at SSRN: <https://ssrn.com/abstract=3512994>

Examples

```
x = PerformanceAnalytics::edhec[,c("Short Selling")]
y = PerformanceAnalytics::edhec[,c("Convertible Arbitrage")]
Normalized_Cross_Sample_Entropy = NormXASampEn(x, y, m=2, r=0.2)
```

OtherExposure-class *OtherExposure Class*

Description

Creates a OtherExposure Object with the relevant info needed to calculate the Exposure-at-Default (EAD)

Arguments

Notional	The notional amount of the trade
MTM	The mark-to-market valuation of the trade
Currency	The currency set that the trade belongs to
Si	The number of years that the trade will take to start (zero if already started)
Ei	The number of years that the trade will expire
BuySell	Takes the values of either 'Buy' or 'Sell'
SubClass	Defines the hedging set the relevant trade will belong to

Value

An object of type OtherExposure

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Regulation (EU) 2019/876 of the European Parliament and of the Council of 20 May 2019 <http://data.europa.eu/eli/reg/2019/876>

Examples

```
tr1 = OtherExposure(Notional=10000,MtM=-50,Si=0,Ei=10,
BuySell='Buy',SubClass='Other_1')
```

ParseTrades

Parse trades through a .csv file.

Description

Parse trades through a .csv file. In case no file name is given, an example file is automatically loaded containing trades corresponding to Basel's SA-CCR regulation (the example trades file can be found on the extdata folder in the installation library path)

Usage

```
ParseTrades(csvfilename)
```

Arguments

csvfilename the name of csv file containing the trades

Value

A list of trades

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

Examples

```
## calling ParseTrades() without an argument loads a test file containing all
## the different trade types supported
example_trades = ParseTrades()
```

SampleEntropy*Sample Entropy*

Description

Calculates the sample entropy of a track record. Sample entropy is an improvement of the approximate entropy and should produce accurate results for timeseries of smaller length like historical returns of strategies

Usage

```
SampleEntropy(returns, m = 2, r = 0.2)
```

Arguments

returns	a vector containing the track record of the underlying asset/strategy, these will be normalized during the algorithm
m	an integer value defining the embedding dimension , default value is 2
r	a double value defining the tolerance, default value is 0.2

Value

The sample Entropy of the input returns

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

https://en.wikipedia.org/wiki/Sample_entropy

Examples

```
## calling SampleEntropy() without an argument loads the historical edhec
## data for the "Short Selling" strategy
returns = PerformanceAnalytics::edhec[,c("Short Selling")]
Sample_Entropy = SampleEntropy(returns,m=2,r=0.2)
```

SelectDerivatives *Select the derivatives out of a trades' list*

Description

Select the derivatives out of a trades' list which will be utilized to calculate the CCR Exposure.

Usage

```
SelectDerivatives(trades_list)
```

Arguments

trades_list the file holding the trades of the portfolio

Value

The derivatives out of a trades' list

Author(s)

Tasos Grivas <info@openriskcalculator.com>

References

Regulation (EU) 2019/876 of the European Parliament and of the Council of 20 May 2019 <http://data.europa.eu/eli/reg/2019/876>

VariationOfInformation

Variation of Information

Description

Calculates the variation of information of the track records of two assets/strategies based on the sample entropy.

Usage

```
VariationOfInformation(x, y, m = 2, r = 0.2, normalized = TRUE)
```

Arguments

x	a vector containing the track record of the underlying asset/strategy, this will be normalized during the algorithm
y	a vector containing the track record of the underlying asset/strategy, this will be normalized during the algorithm
m	an integer value defining the embedding dimension , default value is 2
r	a double value defining the tolerance, default value is 0.2
normalized	a boolean value so as to bound the return value between 0 and 1, default value is TRUE

Value

A value containing the variation of information

Author(s)

Tasos Grivas <tasos@openriskcalculator.com>

References

Lopez de Prado, Marcos, Codependence (Presentation Slides) (January 2, 2020). Available at SSRN: <https://ssrn.com/abstract=3512994>

Examples

```
x = PerformanceAnalytics::edhec[,c("Short Selling")]
y = PerformanceAnalytics::edhec[,c("Convertible Arbitrage")]
variation_of_information = VariationOfInformation(x, y, m=2, r=0.2, normalized = TRUE)
```
