

Package ‘bitsqueezr’

January 17, 2020

Type Package

Title Quantize Floating-Point Numbers for Improved Compressibility

Version 0.1.1

Author Daniel Baston <dbaston@gmail.com>

Maintainer Daniel Baston <dbaston@gmail.com>

Description Provides a implementation of floating-point quantization algorithms for use in precision-preserving compression, similar to the approach taken in the 'netCDF operators' (NCO) software package and described in Zender (2016) <doi:10.5194/gmd-2016-63>.

<code>bits_as_string</code>	<i>Generate a text representation of the bits in a double</i>
-----------------------------	---

Description

Generate a character vector of ones, zeros, and spaces, representing the bits in a double. Spaces are used to separate the sign bit, 11 exponent bits, and 52 fraction bits.

Usage

```
bits_as_string(d)
```

Arguments

<code>d</code>	a numeric value
----------------	-----------------

Examples

```
# Output binary representation of pi
bits_as_string(pi)
# 0 10000000000 1001001000011111011010100010001000010110100011000
```

<code>squeeze_bits</code>	<i>Change insignificant bits of numeric values for improved compressibility</i>
---------------------------	---

Description

Change insignificant bits of numeric values to zero or one, increasing the compressibility of files containing the values. Insignificant bits can be "trimmed" (set to zero), "padded" (set to one), or "groomed" (element-wise alternation between trimming and padding). A discussion of these schemes is provided by Zender, Charles (2016) *Statistically-accurate precision-preserving quantization with compression, evaluated in the netCDF operators. Geoscientific Model Development 9(9)*. The file size reduction depends on the level of quantization and the compression algorithm used.

Usage

```
squeeze_bits(x, digits, method = 'trim', decimal = FALSE)
```

Arguments

<code>x</code>	a numeric vector
<code>digits</code>	number of digits to preserve
<code>method</code>	'trim' sets insignificant bits to zero, 'pad' sets insignificant bits to one, and 'groom' alternates between 'trim' and 'pad'
<code>decimal</code>	if TRUE, d will be interpreted to refer to decimal digits rather than significant digits.

Examples

```
# Check file size reduction when retaining 6 significant digits
x <- runif(100)
raw <- tempfile(fileext='.rds')
quantized <- tempfile(fileext='.rds')

saveRDS(x, raw, compress='xz')
saveRDS(squeeze_bits(x, 6, method='trim'), quantized, compress='xz')

file.size(quantized) / file.size(raw)
# 0.6776316

# Display binary representation of pi with various levels of trimming
for (d in 1:15) {
  cat(bits_as_string(squeeze_bits(pi, d, method='trim'))), '\n')
}
```
