Description

Bootstrap standard errors on various network estimation routines, such as EBICglasso from the qgraph package and IsingFit from the IsingFit package. See bootnet

Details

bootnet

binarize 3

Description

This function will transform data into binary data (0,1). If the data is already binary, this function does nothing.

Usage

```
binarize(x, split = "median", na.rm = TRUE, removeNArows = TRUE, verbose = TRUE)
```

Arguments

x	A data frame or matrix
split	Either a function to split on (as character or as function) or a vector. e.g., split = "mean" will split every variable on the mean of that variable, split=2 will make every value above 2 a 1 and every value below 2 a 0 and a vector of the same length as each variable in the dataset will use those elements to split.
na.rm	The na.rm argument used in the split function.
removeNArows	Logical, should rows with NA be removed?
verbose	Output progress to the console?

Value

A binarized data frame

Author(s)

Sacha Epskamp <mail@sachaepskamp.com>

Description

This function takes bootstrap results and returns a inclusion probability network (edge weights indicate how often a certain edge was included in the model). Note that the plotting method automatically uses a black-white color scheme (as edges are not signed and always positive).

Usage

```
bootInclude(bootobject, verbose = TRUE)
```

4 bootInclude

Arguments

bootobject Nonparametric bootstrap results from bootnet

verbose Logical, should progress be reported to the console?

Value

A bootnetResult object with the following elements:

graph The weights matrix of the network

intercepts The intercepts

results The results of the estimation procedure

labels A vector with node labels

nNodes Number of nodes in the network nPerson Number of persons in the network

input Input used, including the result of the default set used

bootnet 5

bootnet

Bootstrapped network estimation

Description

This function can be used to bootstrap network estimation methods so that the spread of parameter and centrality estimates can be assessed. Most important methods are type = 'nonparametric' for the non-parametric bootstrap and type = 'case' for the case-dropping bootstrap. See also Epskamp, Borsboom and Fried (2016) for more details.

Usage

Arguments

data	A data frame or matrix containing the raw data. Must be numeric, integer or ordered factors.		
nBoots	Number of bootstraps		
default	A string indicating the method to use. See documentation at ${\tt estimateNetwork}.$		
type	The kind of bootstrap method to use.		
nCores	Number of cores to use in computing results. Set to 1 to not use parallel computing.		
statistics	Vector indicating which statistics to store. Options are:		
	"edge" Edge-weight		
	"strength" Degree or node-strength		
	"outStrength" Out-degree or Out-strength		
	"inStrength" In-degree or In-strength		
	"expectedInfluence" Expected Influence

fun

"outExpectedInfluence" Outgoing expected influence "inExpectedInfluence" Incoming expected influence "bridgeInDegree" Bridge in-degree (see bridge) "bridgeOutnDegree" Bridge out-degree (see bridge) "bridgeStrength" Bridge-strength (see bridge) "bridgeCloseness" Bridge-closeness (see bridge) "bridgeBetweenness" Bridge-betweenness (see bridge) "rspbc" Randomized shortest paths betweenness centrality (see rspbc) "hybrid" Hybrid centrality (see hybrid) "eigenvector" Eigenvector centrality (see eigenvector) Can contain "edge", "strength", "closeness", "betweenness", "length", "distance", "expectedInfluence", "inExpectedInfluence", "outExpectedInfluence". By default, length and distance are not stored. The modeling framework to use. Automatically detects if data is binary or not. A custom estimation function, when no default set is used. This must be a function that takes the data as input (first argument) and returns either a weights matrix or a list containing the elements "graph" for the weights matrix, "intercepts" for the intercepts (optional) and "results" for the full estimation results (optional). Logical. Should progress of the function be printed to the console? A character vector containing the node labels. If omitted the column names of the data are used. The centrality tuning parameter as used in centrality. Range of nodes to sample in node-drop bootstrap Minimum proportion of cases to drop when type = "case". Maximum proportion of cases to drop when type = "case". Number of sampling levels to test when type = "case". Range of persons to sample in person-drop bootstrap computeCentrality Logical, should centrality be computed? Proportion of persons to sample in bootstraps. Set to lower than 1 for m out of n bootstrap replacement Logical, should replacement be used in bootstrap sampling? A given network structure to use in parametric bootstrap. sampleSize The samplesize to use in parametric bootstrap. intercepts Intercepts to use in parametric bootstrap. Logical, should the analyzed network be weighted? Logical, should the analyzed network be signed? Logical, is the analyzed network directed? Usually does not have to be set and

bootnet 7

includeDiagonal

Logical, should diagonal elements (self-loops) be included in the bootstrap?

Only used when directed = TRUE.

communities Used for bridge centrality measures (see bridge).

useCommunities Used for bridge centrality measures (see bridge).

library Library location to be used in parallel computing.

memorysaver Logical. If TRUE (recommended) then raw bootstrapped data and results are

not stored in the output object. This saves a lot of memory. Set this only to

TRUE if you need the raw results or bootstrap data.

bridgeArgs List of arguments used in the 'bridge' function for computing bridge centrality

... Additional arguments used in the estimator function.

Value

A bootnet object with the following elements:

sampleTable A data frame containing all estimated values on the real sample.

bootTable A data frame containing all estimated values on all bootstrapped samples.

sample A bootnetResult object with plot and print method containing the estimated

network of the real sample.

boots A list of bootnetResult objects containing the raw bootstrap results.

# Plot significant differences (alpha = 0.05) of node strength:
plot(Results1, "strength", plot = "difference")
# Test for difference in strength between node "A1" and "C2":
differenceTest(Results1, "A1", "C2", "strength")
### Case-drop bootstrap ###
# Bootstrap 1000 values, using 8 cores:
Results2 <- bootnet(Network, nBoots = 1000, nCores = 8,
              type = "case")
# Plot centrality stability:
plot(Results2)
# Compute CS-coefficients:
corStability(Results2)
```

bootThreshold

Threshold network based on bootstrapped intervals

Description

This function takes the output of bootnet and returns a network as if it had been estimated using estimateNetwork, but with edges removed (set to zero) based on some significance level.

Usage

bootThreshold(bootobject, alpha = 0.05, verbose = TRUE, thresholdIntercepts = FALSE)

Arguments

bootobject Nonparametric bootstrap results from bootnet

alpha Significance level

bootThreshold 9

verbose Logical, should progress be reported to the console? thresholdIntercepts

Logical, should intercepts also be thresholded?

Value

A bootnetResult object with the following elements:

graph The weights matrix of the network

intercepts The intercepts

results The results of the estimation procedure

labels A vector with node labels

nNodes Number of nodes in the network

nPerson Number of persons in the network

input Input used, including the result of the default set used

# Plot:
plot(Network_thresholded)

## End(Not run)</pre>
```

10 corStability

corStability

Correlation stability coefficient

Description

This coefficient denotes the estimated maximum number of cases that can be dropped from the data to retain, with 95% probability, a correlation of at least 0.7 (default) between statistics based on the original network and statistics computed with less cases. This coefficient should not be below 0.25 and is preferably above 0.5. See also Epskamp, Borsboom and Fried (2016) for more details.

Usage

```
corStability(x, cor = 0.7, statistics = "all", verbose = TRUE)
```

Arguments

X Output of bootnet. Must be case-drop bootstrap.

cor The correlation level tot est at.

statistics The statistic(s) to test for. Can also be "all".

verbose Logical, should information on the progress be printed to the console?

```

differenceTest 11

```
type = "case")
# Compute CS-coefficients:
corStability(Results2)
## End(Not run)
```

differenceTest

Bootstrapped difference test

Description

This function computes the bootstrapped difference test for edge-weights and centrality indices. A confidence interval is constructured on the difference of two values, and the test is deemed significant if zero is not in this confidence interval. See also Epskamp, Borsboom and Fried (2016) for more details.

Usage

```
differenceTest(bootobject, x, y, measure = c("strength", "closeness", "betweenness"), alpha = 0.05, x2, y2, verbose = TRUE)
```

Arguments

bootobject	Output of bootnet. Must be nonparametric or parametric bootstrap.
х	A character string indicating the ID of a node or an edge, or a number indiacting the node or edge. For an edge, can be e.g., "12" or " $x = 1$, $x = 2$ ".
У	A character string indicating the ID of a node or an edge, or a number indiacting the node or edge. For an edge, can be e.g., "12" or " $y = 1$, $y2 = 2$ ".
measure	Measure to test. Can be "strength", "closeness", "betweenness", "edge" or "distance".
alpha	Signifiance level to test at. Note that the actual signifiance level is influenced by the number of bootstrap samples, and is returned in a message.
x2	Second node in an edge. optional.
y2	Second node in an edge. optional.
verbose	Logical, should the message indiacting actual signifiance level be printed?

estimateNetwork

Estimate a network structure

Description

This function allows for flexible estimation of a network structure using various R packages and model frameworks. This is typically done by using one of the default sets. See details for manual specification. See also Epskamp, Borsboom and Fried (2016) for more details. IMPORTANT: THE ESTIMATOR FUNCTIONS (e.g., fun = bootnet_pcor) ARE NOT INTENDED TO BE USED MANUALY (see details).

Usage

```
bootnet_EBICglasso(data, tuning = 0.5, corMethod = c("cor", "cov",
                   "cor_auto", "npn", "spearman"), missing =
                   c("pairwise", "listwise", "fiml", "stop"), sampleSize
                   = c("pairwise_average", "maximum", "minimum",
                   "pairwise_maximum", "pairwise_minimum"), verbose =
                   TRUE, corArgs = list(), refit = FALSE,
                   principalDirection = FALSE, lambda.min.ratio = 0.01,
                   nlambda = 100, threshold = FALSE, unlock = FALSE,

```

Arguments

data

A data frame or matrix containing the raw data. Must be numeric, integer or ordered factors.

default

A string indicating the method to use. Specifying a default sets default values to prepFun, prepArgs, estFun, estArgs, graphFun, graphArgs, intFun and intArgs. Setting a default can be omitted but that does require specifying all above mentioned arguments. Current options are:

- "EBICglasso" Gaussian Markov random field estimation using graphical LASSO and extended Bayesian information criterion to select optimal regularization parameter. Using EBICglasso from the qgraph package. Calls bootnet_EBICglasso.
- "IsingFit" Ising model estimation using LASSO regularized nodewise logistic regression and extended Bayesian information criterion to select optimal regularization parameter. Using IsingFit from the IsingFit package. Calls bootnet_IsingFit.
- "IsingSampler" Calls the EstimateIsing function from the IsingSampler package.
- "pcor" Partial correlation network (non-regularized Gaussian Markov random field), using cor2pcor from the corpcor package. Calls bootnet_pcor.
- "cor" Correlation network.
- "huge" Uses EBIC model selection of GGM networks estimated via the glasso algorithm as implemented in the huge package (as opposed to glasso and qgraph packages used in default = "EBICglasso"). Uses nonparanormal transformation in preparing the data and does not use polychoric correlations. Calls bootnet_huge.
- "mgm" Estimates a Mixed graphical model by using the the mgm (or mgmfit in older versions) function of the mgm package. Calls bootnet_mgm.
- "TMFG" Estimates a Triangulated Maximally Filtered Graph, using the function TMFG of the NetworkToolbox package. Calls bootnet_TMFG. Note that this

> estimates a *correlation network* by default (use the 'graphType' argument to estimate a partial correlation network instead).

"LoGo" Estimates a Local/Global Sparse Inverse Covariance Matrix, using the function LoGo of the NetworkToolbox package. Calls bootnet_LoGo.

"relimp" Estimates a (directed) relative importance network, using the function 'calc.relimp' of the 'relaimpo' package. The 'structureDefault' argument can be used to use a different default set for estimating the structure of the graph. Calls bootnet_relimp.

"ggmModSelect" Estimates an unregularized GGM using the glasso algorithm and stepwise model selection, using the 'ggmModSelect' function from the qgraph package. Calls bootnet_ggmModSelect.

"graphicalVAR" Estimates a graphical VAR model using the graphicalVAR package. This results in two networks which can be plotted using the 'graph' argument in the plot method. Calls bootnet_graphicalVAR.

See details section for a more detailed description.

fun

A custom estimation function, when no default set is used. This must be a function that takes the data as input (first argument) and returns either a weights matrix or a list containing the elements "graph" for the weights matrix, "intercepts" for the intercepts (optional) and "results" for the full estimation results (optional).

tuning

EBIC tuning parameter, used in 'EBICglasso', 'IsingFit', 'huge', 'mgm' and 'ggmModSelect' default sets. Note that the default value differs: 'EBICglasso', 'huge' and 'mgm' use 0.5, 'IsingFit' uses 0.25 and 'ggmModSelect uses 0.

corMethod

Correlation method, used in 'EBICglasso' and 'pcor' default sets. "cor_auto" uses cor_auto for polychoric and polyserial correlations, "cov" uses the cov function for covariances, "cor" will use the cor function for correlations and "npn" will apply the nonparanormal transformation (via huge.npn) and then compute correlations.

missing

How to handle missing data? "pairwise" for pairwise deletion, "listwise" for listwise deletion, "fiml" for full-information maximum likelihood and "stop" to stop with an error.

sampleSize

How will sample size be computed in EBICglasso default set? The default "pairwise_average" will set the sample size to the average of sample sizes used for each individual correlation. Other options are "pairwise_maximum" (largest sample sized used for each individual correlation), "pairwise_minimum" (smallest sample sized used for each individual correlation), "maximum" (takes total number of rows including rows with NA), and "minimum" (takes total number of rows that contain no NA).

corArgs

A list with arguments for the function used defined by corMethod.

threshold

Thresholding to use in partial correlation networks. Can be a fixed number to threshold all absolute edges below this value, 'locfdr' for local FDR, or any option corresponding to adjustments in corr.p ('none', 'sig', 'holm', 'hochberg', 'hommel', 'bonferroni', 'BH', 'BY' or 'fdr')).

refit

Logical used in EBICglasso default set: should the estimated model structure be refitted without LASSO regularization?

rule The rule to use to select an edge in nodewise estimation. "AND" to only select in

edge if both regression coefficients are nonzero and "OR" if only one is nonzero.

Used in 'IsingFit' and 'mgm' default sets.

split A function or character string ("median" or "mean") indicating how to binarize

values when estimating an Ising model.

method The estimation method used in the IsingSampler default set (see EstimateIsing).

npn Logical, should nonparanormal be used in huge default set?

criterion The criterion used in model selection. "ebic", "ric" or "stars" in the huge

default set or "EBIC" or "CV" in the mgm default set.

nFolds Number of folds used in k-fold cross-validation.

type For mgm, see mgm or mgmfit; for relative importance networks, see calc.relimp

level See mgm. Automatically set if not assigned.

order Order up until including which interactions are included in the model. See mgm.

Automatically set if not assigned.

binarySign See mgm. Automatically set if not assigned.

normalized Should normalized relative importance be used in relative importance networks?

structureDefault

In relative importance networks, default set used to compute the graph structure. Any other arguments used (using ...) are sent to the graph estimator function as

well.

graphType "cor" to estimate a correlation network and "pcor" to estimate a partial corre-

lation network (GGM)

alpha Significance level to test at.

principalDirection

Rescales variables according to the sign of the first eigen-vector. This will lead to most correlations to be positive (positive manifold), leading to negative edges

to be substantively interpretable.

stepwise Logical indicating if 'ggmModSelect' should use stepwise estimation.

start See ggmModSelect

labels A character vector containing the node labels. If omitted the column names of

the data are used.

verbose Logical, currently only used when default = "EBICglasso" in the cor_auto

function.

weighted Logical, should the analyzed network be weighted? signed Logical, should the analyzed network be signed?

directed Logical, is the analyzed network directed? Usually does not have to be set and

is detected automatically.

datatype "normal" if the data argument is a data frame, or "graphicalVAR" if the data

argument is a data list that can be used as input to the graphicalVAR package.

checkNumeric Logical: should the data be checked to be numeric?

lambda.min.ratio

Minimal lambda ratio (LASSO tuning parameter)

nlambda Number of LASSO tuning parameters to test Number of cores to use in estimating networks nCores A list of arguments used in the estimation function set by a default set or by the .dots fun argument. A list of arguments used in the estimation function set by a default set or by the fun argument. .input Used internally in the bootnet function. Do not use. memorysaver Logical. If TRUE attempts to save memory (RAM) by removing some objects from the output. Used by bootnet by default for bootstraps. cutoff Cutoff score for sum-score to condition on when using default = "piecewiseIsing". This is *experimental*! IsingDefault Default set for Ising model structure estimation in piecewise Ising estimation. This is *experimental*! zeroThreshold Used in piecewise Ising estimation. Proportion of edges needed to be exactly 0 in pieces to set edge to zero in final network. This is *experimental*! minimalN Used in piecewise Ising estimation. Minimal sample sizes needed in piece estimation. This is *experimental*! eqThreshold Used in SVAR_lavaan estimation (stepup SVAR estimation). This is *experimental*! Maximum difference in criterion to decide if two models are equivalent (and select one at random). Used in SVAR_lavaan estimation (step up SVAR estimation). This is *experitempWhitelist mental*! Matrix with edges to be whitelisted in the temporal model. The matrix should contain two columns and a row for each edge. The elements should be characters indicating the variable names of each edge (from, to). Used in SVAR_lavaan estimation (step up SVAR estimation). This is *experitempBlacklist mental*! Matrix with edges to be blacklisted in the temporal model. The matrix should contain two columns and a row for each edge. The elements should be characters indicating the variable names of each edge (from, to). contWhitelist Used in SVAR_lavaan estimation (step up SVAR estimation). This is *experimental*! Matrix with edges to be whitelisted in the contemporaneous model. The matrix should contain two columns and a row for each edge. The elements should be characters indicating the variable names of each edge (from, to). contBlacklist Used in SVAR_lavaan estimation (step up SVAR estimation). This is *experimental*! Matrix with edges to be blacklisted in the contemporaneous model. The matrix should contain two columns and a row for each edge. The elements should be characters indicating the variable names of each edge (from, to). Minimal modification index to consider when adding parameters in SVAR search. minimalModInd adjacency An 'adjacency' matrix indicating the graph structure (zeroes indicate a missing edge). nonPositiveDefinite Set to "stop" to stop with an error when the input matrix is not positive definite, and to "continue" (old behavior) to continue anyway.

Set to TRUE to not result in a standard error. This is to prevent using the inner

functions seperatly (see details below).

unlock

transform Should data be transformed before estimate the network? "rank" will call rank_transformation and "quantile" will call quantile_transformation.

Penalty to use in the GGMncv methods.

Details

The user can manually specify an estimation method by assigning a custom function to the 'fun' argument. This function must take data as input and output an estimated network. Fhe functions bootnet_correspond to the functions used when using default sets. E.g, default = "pcor" sets fun = bootnet_pcor. As the ... leads to any argument to estimateNetwork to be passed to the estimator function, the arguments described above in these estimator functions can be used for the appropriate default method. For example, if default = "pcor", the arguments of fun = bootnet_pcor can be used in estimateNetwork. IMPORTANT NOTE: DO NOT USE THE ESTIMATOR FUNCTIONS (e.g., fun = bootnet_pcor) YOURSELF, THEY ARE ONLY INCLUDED HERE TO SHOW WHICH ARGUMENTS YOU CAN USE IN estimateNetwork.

genGGM

Generates a GGM small-world network.

Description

Simulates a GGM as described by Yin and Li (2011), using the Watts and Strogatz (1998) algorithm for generating the graph structure (see watts.strogatz.game).

Usage

```
genGGM(Nvar, p = 0, nei = 1, parRange = c(0.5,1), constant = 1.5, propPositive = 0.5, clusters = NULL, graph = c("smallworld", "random", "scalefree", "hub", "cluster"))
```

Arguments

Nvar	Number of nodes
p	Rewiring probability if graph = "smallworld" or "cluster", or connection probability if graph = "random". If cluster, can add multiple p's for each cluster, e.g., $"c(.1, .5)"$
nei	Neighborhood (see watts.strogatz.game).
parRange	Range of partial correlation coefficients to be originally sampled.
constant	A constant as described by Yin and Li (2011).
propPositive	Proportion of edges to be set positive.
clusters	Number of clusters if graph = "cluster"
graph	Type of graph to simulate

ggmGenerator 21

ggmGenerator Generates a function that simulates data from the Gaussian graphical model (GGM)	ıl
-----------------------------------------------------------------------------------------------	----

Description

Generates data given a partial correlation network. Data can be made ordinal by using a threshold model with equally spaced thresholds.

Usage

Arguments

ordinal Logical, should ordinal data be generated?

nLevels Number of levels used in ordinal data.

skewFactor How skewed should ordinal data be? 1 indicates uniform data and higher values increase skewedness.

type Should thresholds for ordinal data be sampled at random or determined uniformly?

missing Proportion of data that should be simulated to be missing.

Author(s)

Sacha Epskamp <mail@sachaepskamp.com>

IsingGenerator	Generates a function that simulates data from the Ising model	

Description

Uses IsingSampler to generate the data.

Usage

```
IsingGenerator(...)
```

Arguments

.. Arguments passed to IsingSampler

Value

A function with as first argument the sample size and as second argument a named list, with element graph encoding a weights matrix and element intercepts encoding thresholds.

Author(s)

Sacha Epskamp <mail@sachaepskamp.com>

multiverse

Multiverse plot of bootnet results

Description

This function makes a 'multiverse' plot of bootstrap results. Every row indicates an edge and every column a bootstrap; colors are in line of the edge strength as drawn with plot.bootnetResult.

Usage

```
multiverse(x, labels = FALSE)
```

Arguments

x Results from bootnet

labels Logical, should labels be printed next to the plot?

Author(s)

Sacha Epskamp <mail@sachaepskamp.com>

netSimulator

Network Estimation Performance

Description

This function can be used to run a simulation study on the performance of network estimation by varying sample size or any argument used as input to <code>estimateNetwork</code>. The purpose of this function is to provide a way to assess the required sample size given a network structure, as well as to easily perform simulation studies. By default, the function uses <code>genGGM</code> to simulate a chain graph or small-world network. See details for more information. The <code>replicationSimulator</code> function instead assesses how well a network based on a second independent sample would replicate the network based on the first independent sample.

Usage

```
netSimulator(
      input = genGGM(Nvar = 10),
      nCases = c(50, 100, 250, 500, 1000, 2500),
      nReps = 100,
      nCores = 1,
      default,
      dataGenerator,
      moreArgs = list(),
      moreOutput = list())
replicationSimulator(
      input = genGGM(Nvar = 10),
      nCases = c(50, 100, 250, 500, 1000, 2500),
      nReps = 100,
      nCores = 1,
      default,
      dataGenerator,
      . . . ,
      moreArgs = list())
```

Arguments

input	Either a weights matrix	c a list containing el	lements graph (enco	oding the weights
Inpac	Dittier a weights matrix	i, a noi containing ci	cincino di apii (ciici	Julia ule weights

matrix) and intercepts (encoding the intercepts), or a function generating such objects. By default, genGGM is used to generate a Gaussian graphical model. However, it is recommended to replace this with a prior expected graph structure.

nCases The sample sizes to test for.

nReps Number of repetitions per sampling level.

nCores Number of cores to use. Set to more than 1 to use parallel computing.

default Default set used (see estimateNetwork). In most cases, this will set dataGenerator

to the relevant generator.

dataGenerator A function that generates data. The first argument must be the sample size, the

second argument must be the output of input. Can often be ignored if default

is set.

moreArgs A named list of arguments to be used when estimating the network, but which

should not be interpreted as different conditions. Use this argument to assign

arguments that require vectors.

moreOutput List with functions that take the estimated weights matrix as first argument and

the true weights matrix as second argument to produce some output.

... Arguments used by estimateNetwork to estimate the network structure. Pro-

viding a vector for any argument will simulate under each value. This way, any

argument in estimateNetwork can be used in a simulation study.

Details

any argument to estimateNetwork can be used in a simulation study, with a vector (e.g., rule = c("AND", "OR")) specifying that both conditions are tested. Adding too many conditions can quickly make any simulation study intractible, so only vary some arguments! The dataGenerator argument can be any function that generates data. Currently, only ggmGenerator and IsingGenerator are implemented in bootnet itself, which generates data given a Gaussian graphical model.

 $net Simulator \ and \ replication Simulator \ methods \\ net Simulator \ S3 \ methods$

Description

Plot, print and summary methods for netSimulator output.

Usage

null 27

Arguments

x	Output of netSimulator.
object	Output of netSimulator.
xvar	String indicating the variable to be used on the x-axis.
yvar	String vector indicating the variable(s) to be used on the y-axis.
xfacet	String indicating the variable to be used on the horizontal facets (or "." to omit).
yfacet	String indicating the variable to be used on the vertical facets (or "." to omit).
color	String indicating the variable to be used in coloring boxplots.
ylim	Y-axis limits.
print	Logical, should the plot be printed? This helps printing the plots to PDF files.
digits	Number of digits to be used in print and summary method.
xlab	X-axis label
ylab	Y-axis label. Defaults to combining the values in yvar. Is hidden when xfacet = "measure", as then it is clear what the y-axis represent from the facet labels.
outlier.size	Size of the outliers as plotted in boxplots.
boxplot.lwd	Line width of the boxplots
style	"fance" for a style including several aesthethic enhancements, and "basic" for a as simple as possible style.
	$Arguments\ sent\ to\ "\verb plot.netSimulator" from\ "\verb plot.replicationSimulator" $

Sacha Epskamp <mail@sachaepskamp.com>

null	Returns NULL	

Description

This function simply returns NULL.

Usage

```
null(...)
```

28 plot.bootnet

Arguments

... Anything

Author(s)

Sacha Epskamp <mail@sachaepskamp.com>

Examples

```
null("Not NULL")
```

plot.bootnet

Plots bootnet results

Description

This function can be used to plot bootnet results by plotting all bootstrapped statistics as line or by plotting confidence intervals.

Usage

Arguments

x A bootnet object

statistics The

The types of statistics to plot. Defaults to "edge" for regular bootstrap and c("strength", "outStrength for node and person drop bootstrap. Use "all" to obtain all pairwise statistics tested for regular bootstraps and all nodewise statistics tested for person and node drop bootstarps.

plot

Character string indicating what to plot. Can be "area" to produce a graph with the area indicating the confidence region, or "difference" producing a plot showing significant differences. Other options are "line" and "interval", which are currently unstable and not recommended to use.

plot.bootnet 29

graph If multipe graphs are estimated, which graph should be plotted? Currently

used for default = "graphicalVAR" to plot a temporal network using graph = "temporal" or a contemporaneous network using graph = "contemporaneous"

CIstyle Style of CIs to construct. "SE" shows the sample statistic plus and minus two

times the standard deviation of bootstraps, and "quantiles" the area between

the 2.5th and 97.5th quantile. Defaults to "quantiles".

rank Logical, should plots show rank of statistics instead of statistics?

sampleColor Color of the original sample line
samplelwd Line width of the original sample line

bootColor Color of the bootstrap lines
bootAlpha Alpha of the bootstrap lines
bootlwd Line width of the bootstrap lines

areaAlpha Alpha of the area

order String indicating how to order nodes. "id" will order nodes based on their name,

"mean" will order nodes based on the average bootstrapped value of the first statistic in statistics, and "sample" will order the nodes as done in "mean"

but orders ties based on their sample value.

decreasing Logical indicating if the ordering is decreasing or increasing.

perNode Logical, should centrality estimates per node be plotted instead of correlation

with original parameter. Only used in node and person drop bootstrap.

legendNcol Number of columns in the legend if perNode = TRUE.

labels Logical, should labels be plotted?

Logical, should the legend be plotted?

subsetRange Range in percentages of the x-axis in node and person drop plots.

area Logical, should the confidence area be plotted?

alpha Signifiance level used in plot = "difference".

onlyNonZero Logical used when plot = "difference", statistics = "edge", should only

edges be included that were nonzero in the estimated network structure?

differenceShowValue

Logical used when plot = "difference". Should values be shown in the diag-

onal of the difference plot?

differenceEdgeColor

Logical used when plot = "difference", statistics = "edge". Should di-

agonal blocks be colored according to default edge colors?

verbose Should expected alpha be printed?
panels Logical, should panel titles be printed?

meanColor Color of the bootstrap means.

meanlwd Line width of the bootstrap means

split0 Logical. When set to TRUE, the displayed intervals are based on occasions

when the parameter was not estimated to be zero, and an extra box is added

indicating the number of times a parameter is estimated to be zero.

30 plot.bootnetResult

Logical, should boxes indicating the proportion of times parameters were estiprop0 mated to be zero be added to the plot? Size of the boxes indicating number of times a parameter was set to zero. prop0_cex prop0_alpha Transparency of the boxes indicating number of times a parameter was set to prop0_minAlpha Minimal transparency of the *lines* of plotted intervals as the proportion of times an edge was not included goes to 0. subset Vector indicating labels of nodes to include in the plot. This can be used to show,

for example, only edges related to one particular node.

Not used.

Value

A ggplot2 object.

Author(s)

Sacha Epskamp <mail@sachaepskamp.com>

Plot method for bootnetResult objects plot.bootnetResult

Description

Plots the graph using the qgraph package and the qgraph function. Defined as qgraph::qgraph(x[['graph']],labels=x[[

Usage

```
## S3 method for class 'bootnetResult'
plot(x, graph, weighted, signed, directed, labels, layout =
                 "spring", parallelEdge = TRUE, cut = 0, theme =
                 "colorblind", bootIncludeOverwrite = TRUE, ...)
```

Arguments

X	A bootnetResult object
graph	Numeric or string indicating which graph to plot. Only needed when multiple
	graphs are estimated. For example, when using default = "graphicalVAR".

graph = "temporal" plots the temporal network and graph = "contemporaneous"

plots the contemporaneous network.

weighted Logical, should the analyzed network be weighted? signed Logical, should the analyzed network be signed?

Logical, is the analyzed network directed? Usually does not have to be set and directed

is detected automatically.

print.bootnet 31

labels Labels of the nodes. Defaults to the column names of the data if missing.

Placement of the nodes. See qgraph. Always defaults to "spring".

parallelEdge Should edges in directed networks be plotted parallel? See qgraph. Defaults to

TRUE instead of FALSE (as in qgraph).

cut Should scaling in width and saturation of edges be split? See qgraph. Defaults

to 0 to disable cut (qgraph chooses a cutoff with at least 20 nodes).

theme Theme of the edge and node colors. See qgraph. Defaults to "colorblind"

rather than the default used in qgraph ("classic").

bootIncludeOverwrite

Logical. If TRUE, several plot defaults are overwritten when the input is the result

of bootInclude (e.g., edge colors are set to black and white).

... Arguments sent to qgraph.

Author(s)

Sacha Epskamp <mail@sachaepskamp.com>

print.bootnet

Print method for bootnet and bootnetResult objects

Description

Prints a short overview of the results of bootnet

Usage

```
## S3 method for class 'bootnet'
print(x, ...)
## S3 method for class 'bootnetResult'
print(x, ...)
## S3 method for class 'bootnetResult'
summary(object, ...)
```

Arguments

x A bootnet or bootnetResult object

object A bootnetResult object

. . . Not used.

Author(s)

Sacha Epskamp < mail@sachaepskamp.com>

32 summary.bootnet

mmary.bootnet Summarize bootnet results

Description

Creates a data frame (wrapped as tbl_df) containing summarized results of the bootstraps.

Usage

Arguments

object	A bootnet object
graph	Numeric or string indicating which graph to summarize. Only needed when multiple graphs are estimated. For example, when using default = "graphicalVAR", graph = "temporal" plots the temporal network and graph = "contemporaneous" plots the contemporaneous network.
statistics	The types of statistics to include in the summary table
perNode	Logical, should centrality estimates per node be plotted instead of correlation with original parameter. Only used in node and person drop bootstrap.
rank	Logical, should plots show rank of statistics instead of statistics?
tol	Tolerance level for assuming an edge is set to zero.
•••	Not used.

Value

A tbl_df (data frame) containing summarized statistics.

Author(s)
