Package 'geoelectrics'

August 28, 2018

Title 3D-Visualization of Geoelectric Resistivity Measurement Profiles

Version 0.2.0

Author Anja Kleebaum <kleebaum@informatik.uni-heidelberg.de>

Maintainer Anja Kleebaum <kleebaum@informatik.uni-heidelberg.de>

Description
Visualizes two-dimensional geoelectric resistivity measurement profiles in three dimensions.

Depends R (>= 3.0), lattice, rgl, fields

R topics documented:

`adjustHeight` *Adjust Profile Height*

Description

Adjusts the height of a single profile (adds a delta value to ALL data points). This is necessary if GPS measurement heights of two profiles differ systematically.

Usage

```
adjustHeight(object, delta)

## S4 method for signature 'Profile'
adjustHeight(object, delta)
```

Arguments

`object`	a single Profile.
`delta`	positive or negative value.

Value

adjusted profile

See Also

`GpsCoordinates-class`, `Profile-class`

Examples

```
p3 <- new(
  "Profile",
  title = "Profile 3",
  processedData =
    new("ProcessedData",
        address = system.file("extdata/processed/p3_DipolDipol_S-N.xyz",
                  package='geoelectrics')),
```

```
  rawData =
    new("RawData",
        address = system.file("extdata/raw/p3_DipolDipol_S-N.dat",
                  package='geoelectrics')),
  measurementType = "DipolDipol",
  gpsCoordinates =
    new("GpsCoordinates",
        address = system.file("extdata/gps/p3.txt",
                  package='geoelectrics'))
)

p3 <- adjustHeight(p3, -10)
```

`calcRelativeCoords` *Calculate Relative Coordinates*

Description

Calculates relative coordinates (unity: meters) from GPS coordinates (either given in UTM or Gauss Krueger). This method is used when a profile set of many profiles is instantiated.

Usage

```
calcRelativeCoords(coords, minLat, minLon)
```

Arguments

`coords`	exact coordinates of a single Profile.
`minLat`	starting point (latititude).
`minLon`	starting point (longitude).

Value

data frame that contains the relative coordinates (latitude and longitude).

See Also

`ProfileSet-class`, `GpsCoordinates-class`

getHeightInformation *Gets the Height Information for a Profile*

Description

Returns the heights for certain distances along the profile (topography information).

Usage

```
getHeightInformation(object)

## S4 method for signature 'ProcessedData'
getHeightInformation(object)
```

Arguments

object	a single Profile.

Value

data frame containing distances and heights along the profile

See Also

GpsCoordinates-class, Profile-class, ProcessedData-class

Examples

```
data(sinkhole)

getHeightInformation(sinkhole@profiles[[1]]@processedData)
```

GpsCoordinates-class *GPS Coordinates Class*

Description

A class to handle gps coordinates.

Slots

address	address of the gps ascii file
exact	data frame that contains measured gps coordinates
relative	relative coordinates, normalized to (0,0)
lm	linear model of the measured gps coordinates
lmRelative	linear model of relative coordinates

See Also

Profile-class, ProfileSet-class, adjustHeight, calcRelativeCoords

Examples

```
gpsCoordinates = new('GpsCoordinates', address = system.file('extdata/gps/p1.txt',
                 package='geoelectrics'))

data(sinkhole)
sinkhole@profiles[[1]]@gpsCoordinates
sinkhole@profiles[[1]]@gpsCoordinates@address
sinkhole@profiles[[1]]@gpsCoordinates@exact
sinkhole@profiles[[1]]@gpsCoordinates@lm
sinkhole@profiles[[1]]@gpsCoordinates@relative
sinkhole@profiles[[1]]@gpsCoordinates@lmRelative
```

---

levelplot *Levelplot of Geoelectrics Data*

Description

Plots the interpolated resistance values of the geoelectrics data.

Usage

```
levelplot(x, data, ...)

## S4 method for signature 'Profile'
levelplot(x, dataType = "processed",
  withTopo = FALSE, xlab = "Length [m]", ylab = "Depth [m]",
  main = paste(x@title), col = colors, breaks = 18, trafo = log,
  backtrafo = exp, ...)

levelplotProcessedData(x, xlab = "Length [m]", ylab = "Depth [m]",
  main = paste(x@title, "without topography"), col = colors,
  breaks = 18, trafo = log, backtrafo = exp, ...)

levelplotProcessedDataWithTopo(x, xlab = "Length [m]",
  ylab = "Height [m]", main = paste(x@title, "with topography"),
  col = colors, breaks = 18, trafo = log, backtrafo = exp, ...)

levelplotRawData(x, xlab = "Length [m]", ylab = "Depth [m]",
  main = paste(x@title, "without topography (raw data)"), col = colors,
  trafo = log, ...)
```

Arguments

x	profile object.
data	is always NULL
...	lattice levelplot arguments.
dataType	specify whether 'processed' (default) or 'raw' data should be plotted
withTopo	TRUE if topography information is plotted
xlab	label for x-axes.
ylab	label for y-axes.
main	title to be plotted.
col	vector of colors.
breaks	number of color breaks.
trafo	transformation to be done on data (default: log).
backtrafo	back transformation to plot correct labels (default: exp).

See Also

Profile-class

Examples

```
data(sinkhole)

levelplot(sinkhole@profiles[[1]], dataType = 'processed', withTopo = FALSE)
levelplotLegendLabel()

levelplot(sinkhole@profiles[[1]], dataType = 'processed', withTopo = TRUE)
levelplotLegendLabel()

levelplot(sinkhole@profiles[[1]], dataType = 'raw')
levelplotLegendLabel()
```

---

levelplotLegendLabel *Levelplot Legend Label*

Description

Plots the label of the levelplot.

Usage

```
levelplotLegendLabel(legend.lab = "Resistivity",
  unit = expression(paste("[", Omega, "m]")))
```

Arguments

legend.lab	label (default: 'Resistivity').
unit	unit (default: 'Ohm*m').

See Also

levelplot

Examples

```
data(sinkhole)

levelplot(sinkhole@profiles[[1]])
levelplotLegendLabel()

levelplot(sinkhole@profiles[[2]])
levelplotLegendLabel()

levelplot(sinkhole@profiles[[3]])
levelplotLegendLabel()
```

---

myColorRamp *Maps color to resistivity value*

Description

Maps color to (resistivity) values. A minimum and maximum value can be specified.

Usage

```
myColorRamp(col, values, minData = min(values), maxData = max(values))
```

Arguments

col	Character vector of colors.
values	Numeric vector of values.
minData	Minimum value (default min(values)). All smaller values will assigned to the first color in vector col.
maxData	Maximum value (default max(values)). All higher values will assigned to the last color in vector col.

parseProcessedDataFile *Parses a Processed Data File*

Description

Parses .xyz files produced by the software Res2DInv. Needs to be overwritten if another processed data format is used.

Usage

```
parseProcessedDataFile(address, skip = 0)
```

Arguments

address	address of the raw data ascii file.
skip	the number of lines of the data file to skip before beginning to read data.

Value

list of two data frames: The first data frame contains points without topography (distance, depth and resistivity values). The second data frame contains points with topography (distance, height and resistivity values).

See Also

ProcessedData-class, Profile-class

Examples

```
fileAddress <- system.file('extdata/processed/p1_DipolDipol_SW-NE.xyz',
                  package = 'geoelectrics')

processedData = new('ProcessedData')
processedData@address = fileAddress
processedData@points <- parseProcessedDataFile(address = fileAddress)[[1]]
processedData@pointsWithTopo <- parseProcessedDataFile(address = fileAddress)[[2]]
```

parseRawDataFile *Parses a Raw Data File*

Description

Parses a geoelectrics raw data file created by the GeoTest software by Dr. Rauen. Needs to be overwritten if another raw data format is used.

Usage

```
parseRawDataFile(address, skip = 9)
```

Arguments

address	address of the raw data ascii file.
skip	the number of lines of the data file to skip before beginning to read data.

Value

data frame containing distance, depth and resistivity values

See Also

RawData-class, Profile-class

Examples

```
fileAddress <- system.file('extdata/raw/p1_DipolDipol_SW-NE.dat',
                  package = 'geoelectrics')

rawData = new('RawData')
rawData@address = fileAddress
rawData@points <- parseRawDataFile(address = fileAddress)
```

plot,Profile,ANY-method *Plot Geoelectrics Data Points*

Description

Plots the geoelectrics data points of a profile.

Usage

```
## S4 method for signature 'Profile,ANY'
plot(x, dataType = "processed", withTopo = T,
  xlab = "Length [m]", ylab = "Height [m]", main = paste(x@title,
  "with topography"), asp = 1, ...)

plotProcessedData(x, xlab = "Length [m]", ylab = "Depth [m]",
  main = paste(x@title, "without topography"), ...)

plotProcessedDataWithTopo(x, xlab = "Length [m]", ylab = "Height [m]",
  main = paste(x@title, "with topography"), ...)

plotRawData(x, xlab = "Length [m]", ylab = "Depth [m]",
  main = paste(x@title, "without topography"), ...)

plotRawDataWithTopo(x, xlab = "Length [m]", ylab = "Depth [m]",
  main = paste(x@title, "with topography"),
  height = x@processedData@height, spline = TRUE, ...)
```

Arguments

x	profile object.
dataType	specify whether 'processed' (default) or 'raw' data should be plotted
withTopo	TRUE if topography information is plotted
xlab	label for x-axes.
ylab	label for y-axes.
main	title to be plotted.
asp	the y/x aspect ratio (default: 1).
...	plot parameters (such as pch, cex, col, ...).
height	topo data frame of distances and height.
spline	if TRUE spline interpolation is conducted.

See Also

Profile-class, plot3d, levelplot

Examples

```
data(sinkhole)

plot(sinkhole@profiles[[1]], dataType = 'processed', withTopo = FALSE)
plotProcessedData(sinkhole@profiles[[1]])

plot(sinkhole@profiles[[1]], dataType = 'processed', withTopo = TRUE)
plotProcessedDataWithTopo(sinkhole@profiles[[1]])

plot(sinkhole@profiles[[1]], dataType = 'raw', withTopo = FALSE)
```

```
plotRawData(sinkhole@profiles[[1]])

plot(sinkhole@profiles[[1]], dataType = 'raw', withTopo = TRUE)
plotRawDataWithTopo(sinkhole@profiles[[1]])
```

---

plot3d,ProfileSet-method

3D Scatterplot of Geoelectrics Profiles

Description

Plots the interpolated resistance values of the processed data for a single profile or a set of profiles.

Usage

```
## S4 method for signature 'ProfileSet'
plot3d(x, title = x@title, sub = "",
  xlab = "", ylab = "", zlab = "", minData = x@minData,
  maxData = x@maxData, col = colors, trafo = log,
  psize = pointsize, ...)

## S4 method for signature 'Profile'
plot3d(x, title = "", sub = "", xlab = "",
  ylab = "", zlab = "", minData = x@processedData@minData,
  maxData = x@processedData@maxData, col = colors, trafo = log,
  psize = pointsize, ...)
```

Arguments

x	either an object of a single Profile or a ProfileSet.
title	title to be plotted.
sub	subtitle to be plotted.
xlab	label of the x-axes, e.g. length [m].
ylab	label of the y-axes, e.g. height above sea level [m].
zlab	label of the z-axes, e.g. length [m].
minData	mimimum value to adjust color bar.
maxData	maximum value to adjust color bar.
col	vector of colors.
trafo	transformation to be done on data (default: log).
psize	size of value points (default: 10).
...	parameters passed to points3d method of rgl package

See Also

Profile-class, ProfileSet-class, plot, levelplot

Examples

```
data(sinkhole)

plot3d(sinkhole@profiles[[1]])
plot3d(sinkhole)
```

`plotIntersect` *Plot Profile Intersection*

Description

Plots resistivity against height on and next to the intersection line between two profiles.

Usage

```
plotIntersect(.Object1, .Object2 = NULL,
  xlab = "Height above sea level [m]",
  ylab = expression(paste("Resistivity [", Omega, "m]")), main = "",
  trafo = log, backtrafo = exp, col = colors, pch = c(20, 20),
  type = "p", legendLoc = "bottomleft")

## S4 method for signature 'ProfileSet,ANY'
plotIntersect(.Object1, xlab, ylab, main, trafo,
  backtrafo, col, pch, type, legendLoc)

## S4 method for signature 'Profile,Profile'
plotIntersect(.Object1, .Object2 = NULL,
  xlab = "Height above sea level [m]",
  ylab = expression(paste("Resistivity [", Omega, "m]")), main = "",
  trafo = log, backtrafo = exp, col = colors, pch = c(20, 20),
  type = "p", legendLoc = "bottomleft")
```

Arguments

`.Object1`	either a single Profile or a ProfileSet.
`.Object2`	either a second single Profile or NULL if .Object1 is of type ProfileSet.
`xlab`	label of the x-axes, e.g. length [m].
`ylab`	label of the y-axes, e.g. height above sea level [m].
`main`	title to be plotted.
`trafo`	transformation to be done on data (default: log).
`backtrafo`	back transformation to plot correct labels (default: exp).
`col`	character vector of colors.
`pch`	numeric vector of plotting symbols.

type	plot type (default "p" for points). "b" for both points and lines, "c" for empty points joined by lines, "o" for overplotted points and lines, "s" and "S" for stair steps and "h" for histogram-like vertical lines. Finally, "n" does not produce any points or lines.
legendLoc	legendLocation (default "bottomleft").

See Also

ProfileSet-class

Examples

```
data(sinkhole)

plotIntersect(sinkhole)
plotIntersect(sinkhole@profiles[[1]], sinkhole@profiles[[2]])
```

---

plotLegend *Plots Legend*

Description

Plots the legend for resistivity values.

Usage

```
plotLegend(.Object, legend.lab = expression(paste("Resistivity [", Omega,
  " m]")), minData = 0, maxData = 999999, breaks = NULL,
  legend.line = 2.2, nlevel = 18, lab.breaks = c(), horizontal = T,
  col = colors, trafo = log, backtrafo = exp, ...)

## S4 method for signature 'ProfileSet'
plotLegend(.Object, legend.lab,
  minData = .Object@minData, maxData = .Object@maxData)

## S4 method for signature 'Profile'
plotLegend(.Object, legend.lab,
  minData = .Object@processedData@minData,
  maxData = .Object@processedData@maxData)
```

Arguments

.Object	either a single Profile or a ProfileSet.
legend.lab	label of legend (default: expression(paste("Resistivity [", Omega, "]"))).
minData	minimum value.
maxData	maximum value.

breaks	Break points in sorted order to indicate the intervals for assigning the colors. Note that if there are nlevel colors there should be (nlevel+1) breakpoints. If breaks is not specified (nlevel+1) equally spaced breaks are created where the first and last bin have their midpoints at the minimum and maximum values in z or at zlim.
legend.line	distance in units of character height (as in mtext) of the legend label from the color bar. Make this larger if the label collides with the color axis labels.
nlevel	number of color levels.
lab.breaks	number of breaks.
horizontal	If false legend will be a vertical strip on the right side. If true (default) the legend strip will be along the bottom.
col	vector of colors.
trafo	transformation to be done on data (default: log). For linear scale: function(x) x.
backtrafo	back transformation to plot correct labels (default: exp). For linear scale: function(x) x.
...	image.plot arguments.

See Also

Profile-class, ProfileSet-class, plot3d,

Examples

```
data(sinkhole)

plotLegend(sinkhole)

# for linear scale:
plotLegend(sinkhole@profiles[[1]],
           trafo=function(x) x,
           backtrafo=function(x) x,
           minData=100, maxData=50000)
```

ProcessedData-class *Processed Data Class*

Description

A class to handle processed geoelectrics data in ascii format. The processed data class parses .xyz files produced by the software Res2DInv. If you want to use another format, overwrite the parseProcessedDataFile method.

Slots

`address` address of the processed ascii file

`points` data frame that contains positions and values withouth topography information

`pointsWithTopo` data frame that contains positions and values with topography information

`height` data frame that contains topography information (distances and heights). It is reconstructed from .xyz-file.

`minData` minimum value

`maxData` maximum value

See Also

`parseProcessedDataFile`, `Profile-class`, `ProfileSet-class`

Examples

```
processedData = new('ProcessedData',
                    address = system.file('extdata/processed/p1_DipolDipol_SW-NE.xyz',
                    package='geoelectrics'))

data(sinkhole)
sinkhole@profiles[[1]]@processedData
sinkhole@profiles[[1]]@processedData@points
sinkhole@profiles[[1]]@processedData@pointsWithTopo
sinkhole@profiles[[1]]@processedData@height
sinkhole@profiles[[1]]@processedData@minData
sinkhole@profiles[[1]]@processedData@maxData
```

`Profile-class` *Profile Class*

Description

A class to handle a single profile.

Slots

`title` title of the profile (e.g. Profile 1).

`number` index of the profile.

`processedData` object of Processed Data Class (`ProcessedData-class`).

`rawData` object of Raw Data Class (`RawData-class`).

`measurementType` type of measurement (e.g. Dipole Dipole, Wenner, ...).

`gpsCoordinates` object of GpsCoordinates Class (`GpsCoordinates-class`).

See Also

`ProcessedData-class`, `RawData-class`, `GpsCoordinates-class`, `plot3d`, `plot`

Examples

```
p1 <- new('Profile',
          title = 'Profile 1',
          processedData =
          new('ProcessedData', address = system.file('extdata/processed/p1_DipolDipol_SW-NE.xyz',
                                    package='geoelectrics')),
          rawData =
            new('RawData', address = system.file('extdata/raw/p1_DipolDipol_SW-NE.dat',
                                    package='geoelectrics')),
          measurementType = 'DipoleDipole',
          gpsCoordinates =
            new('GpsCoordinates', address = system.file('extdata/gps/p1.txt',
                                          package='geoelectrics')))

p1@title
p1@processedData
p1@rawData
p1@measurementType
p1@gpsCoordinates

plot3d(p1)
```

`ProfileSet-class` *Profile Set Class*

Description

A class to handle a collection of many profiles.

Slots

`title` title to plot

`profiles` list that contains objects of class Profile (`Profile-class`)

`minLat` minimum latitude value of all profiles

`minLon` minimum longitude value of all profiles

`minData` minimum data value of all profiles

`maxData` maximum data value of all profiles

See Also

`Profile-class`, `plot3d`

Examples

```
# sinkhole <- new('ProfileSet',
#                profiles = list(p1, p2, p3),
#                title='Sinkhole')

data(sinkhole)
plot3d(sinkhole)
```

RawData-class *Raw Data Class*

Description

A class to handle geoelectrics raw data. The raw data class parses .dat files provided by the GeoTest software by Dr. Rauen. If you want to use another format, overwrite the parseRawDataFile method.

Slots

`address` address of the raw data ascii file.

`points` data frame that contains raw data resistance values and their positions (distance and depth).

See Also

parseRawDataFile, Profile-class, ProfileSet-class

Examples

```
rawData = new('RawData', address = system.file('extdata/raw/p1_DipolDipol_SW-NE.dat',
          package='geoelectrics'))

data(sinkhole)
sinkhole@profiles[[2]]@rawData
sinkhole@profiles[[2]]@rawData@address
sinkhole@profiles[[2]]@rawData@points
```

---

sinkhole *Filled Sinkhole*

Description

Geoelectrics profiles measured at a filled sinkhole. This data set contains an object of the ProfileSet class.

Usage

```
# data(sinkhole)
# plot3dXyz(sinkhole)
# plotLegend(sinkhole)

# plotIntersect(sinkhole)

# levelplotXyz(sinkhole@profiles[[1]])
# levelplotLegendLabel()

# plotRaw(sinkhole@profiles[[2]])
# plotRawHeight(sinkhole@profiles[[2]])

# levelplotRaw(sinkhole@profiles[[2]])
# levelplotLegendLabel()
```

Format

Object of Profile Set class including three Profiles.

Index
