Package 'mcmcse'

September 9, 2021

Version 1.5-0

Date 2021-08-29

Title Monte Carlo Standard Errors for MCMC

Author James M. Flegal <jflegal@ucr.edu>,
John Hughes,
Dootika Vats <dootika@iitk.ac.in>,
Ning Dai,
Kushagra Gupta, and
Uttiya Maji

Maintainer Dootika Vats <dootika@iitk.ac.in>

Imports utils, ellipse, Rcpp (>= 0.12.10), fftwtools, testthat

LinkingTo Rcpp, RcppArmadillo

Suggests knitr

Description Provides tools for computing Monte Carlo standard
errors (MCSE) in Markov chain Monte Carlo (MCMC) settings. MCSE
computation for expectation and quantile estimators is
supported as well as multivariate estimations. The package also provides
functions for computing effective sample size and for plotting
Monte Carlo estimates versus sample size.

mcmcse-package   *Monte Carlo Standard Errors for MCMC*

Description

Provides tools for computing Monte Carlo standard errors (MCSE) in Markov chain Monte Carlo (MCMC) settings. MCSE computation for expectation and quantile estimators is supported. The package also provides functions for computing effective sample size and for plotting Monte Carlo estimates versus sample size.

Details

Package:	mcmcse
Type:	Package
Version:	1.5-0
Date:	2021-08-29

Examples

```
n <- 1e3
mu = c(2, 50)
sigma = matrix(c(1, 0.5, 0.5, 1), nrow = 2)
out = BVN_Gibbs(n, mu, sigma)

multiESS(out)
ess(out)
mcse.mat(out)

mcse.bm <- mcse.multi(x = out)
mcse.tuk <- mcse.multi(x = out, method = "tukey")
```

---

batchSize   *Batch size (truncation point) selection*

Description

Function returns the optimal batch size (or truncation point) for a given chain and method.

Usage

```
batchSize(x, method = c("bm", "obm", "bartlett", "tukey", "sub"), g = NULL, fast = TRUE)
```

Arguments

x	A matrix or data frame of Markov chain output. Number of rows is the Monte Carlo sample size.
method	Any of "bm","obm","bartlett","tukey". "bm" represents batch means estimator, "obm" represents the overlapping batch means estimator, and "bartlett" and "tukey" represent the modified-Bartlett window and the Tukey-Hanning windows for the spectral variance estimators.
g	A function that represents features of interest. g is applied to each row of x and thus g should take a vector input only. If g is NULL, g is set to be identity, which is estimation of the mean of the target density.
fast	Boolean variable for fast estimation using a reasonable subset of the Markov chain.

Details

batchSize fits a stationary autoregressive process to the marginals of x, selecting the order of the process as the one with the maximum AIC among the models with coefficients greater than a threshold.

Value

A value of the optimal batch size (truncation point or bandwidth) is returned.

References

Liu, Y., Vats, D., and Flegal, J. M. (2021) Batch size selection for variance estimators in MCMC, *Methodology and Computing in Applied Probability*, to appear.

See Also

[mcse.multi](#) and [mcse](#), which calls on batchSize.

Examples

```
## Bivariate Normal with mean (mu1, mu2) and covariance sigma
n <- 1e3
mu <- c(2, 50)
sigma <- matrix(c(1, 0.5, 0.5, 1), nrow = 2)

out <- BVN_Gibbs(n, mu, sigma)

batchSize(out)
batchSize(out, method = "obm")
batchSize(out, method = "bartlett")
```

BVN_Gibbs   *MCMC samples from a bivariate normal distribution*

Description

Function returns Gibbs samples from a bivariate normal target density.

Usage

```
BVN_Gibbs(n, mu, sigma)
```

Arguments

n	Sample size of the Markov chain.
mu	A 2 dimensional vector. Mean of the target normal distribution.
sigma	2 x 2 symmetric positive definite matrix. The covariance matrix of the target normal distribution.

Value

An n x 2 matrix of the Gibbs samples.

Examples

```
n <- 1e3
mu <- c(2, 50)
sigma <- matrix(c(1, 0.5, 0.5, 1), nrow = 2)
out <- BVN_Gibbs(n, mu, sigma)
```

---

confRegion	*Confidence regions (ellipses) for Monte Carlo estimates*

Description

Constructs confidence regions (ellipses) from the Markov chain output for the features of interest Function uses the ellipse package.

Usage

```
confRegion(mcse.obj, which = c(1,2), level = .95)
```

Arguments

mcse.obj	The list returned by the mcse.multi or mcse.initseq command, or an mcmcse class object.
which	Integer vector of length 2 indicating the component for which to make the confidence ellipse. Chooses the first two by default.
level	confidence level for the ellipse.

Value

Returns a matrix of x and y coordinates for the ellipse. Use plot function on the matrix to plot the ellipse.

Examples

```
## Bivariate Normal with mean (mu1, mu2) and covariance sigma
n <- 1e3
mu <- c(2, 50)
sigma <- matrix(c(1, 0.5, 0.5, 1), nrow = 2)

out <- BVN_Gibbs(n, mu, sigma)

mcerror <- mcse.multi(out, blather = TRUE)

## Plotting the ellipse
plot(confRegion(mcerror), type = 'l')
```

---

ess	*Univariate effective sample size (ESS) as described in Gong and Flgal (2015).*

Description

Estimate the effective sample size (ESS) of a Markov chain as described in Gong and Flegal (2015).

Usage

```
ess(x, g = NULL, ...)
```

Arguments

x	a matrix or data frame of Markov chain output. Number of rows is the Monte Carlo sample size.
g	a function that represents features of interest. g is applied to each row of x and thus g should take a vector input only. Ifcodeg is NULL, g is set to be identity, which is estimation of the mean of the target density.
...	arguments passed on to the mcse.mat function. For example method = "tukey" and size = "cuberoot" can be used.

Details

ESS is the size of an iid sample with the same variance as the current sample for estimating the expectation of g. ESS is given by

$$ESS = n\frac{\lambda^2}{\sigma^2}$$

where λ^2 is the sample variance and σ^2 is an estimate of the variance in the Markov chain central limit theorem. The denominator by default is a batch means estimator, but the default can be changed with the 'method' argument.

Value

The function returns the estimated effective sample size for each component of g.

References

Gong, L. and Flegal, J. M. (2015) A practical sequential stopping rule for high-dimensional Markov chain Monte Carlo, *Journal of Computational and Graphical Statistics*, **25**, 684—700.

See Also

minESS, which calculates the minimum effective samples required for the problem. multiESS, which calculates multivariate effective sample size using a Markov chain and a function g.

---

estvssamp   *Create a plot that shows how Monte Carlo estimates change with increasing sample size.*

Description

Create a plot that shows how Monte Carlo estimates change with increasing sample size.

Usage

```
estvssamp(x, g = mean, main = "Estimates vs Sample Size", add = FALSE, ...)
```

Arguments

x	a sample vector.
g	a function such that $E(g(x))$ is the quantity of interest. The default is g = mean.
main	an overall title for the plot. The default is "Estimates vs Sample Size".
add	logical. If TRUE, add to a current plot.
...	additional arguments to the plotting function.

Value

NULL

Examples

```
## Bivariate Normal with mean (mu1, mu2) and covariance sigma
n <- 1e3
mu <- c(2, 50)
sigma <- matrix(c(1, 0.5, 0.5, 1), nrow = 2)

out <- BVN_Gibbs(n, mu, sigma)

estvssamp(out[,1], main = expression(E(x[1])))
```

---

is.mcmcse   *Check if the class of the object is mcmcse*

Description

Check if the class of the object is mcmcse

Usage

```
is.mcmcse(x)
```

Arguments

x   The object that is checked to belong to the class mcmcse

Value

Boolean variable indicating if the input belongs to the class mcmcse

Examples

```
## Bivariate Normal with mean (mu1, mu2) and covariance sigma
n <- 1e3
mu <- c(2, 50)
sigma <- matrix(c(1, 0.5, 0.5, 1), nrow = 2)

out <- BVN_Gibbs(n, mu, sigma)
is.mcmcse(mcse.multi(out))
```

---

mcse   *Compute Monte Carlo standard errors for expectations.*

Description

Compute Monte Carlo standard errors for expectations.

Usage

```
mcse(x, size = NULL, g = NULL, r = 3,  method = "bm", warn = FALSE)
```

Arguments

x	a vector of values from a Markov chain of length n.
size	represents the batch size in "bm" and the truncation point in "bartlett" and "tukey". Default is NULL which implies that an optimal batch size is calculated using the batchSize function. Can take character values of "sqroot" and "cuberoot" or any numeric value between 1 and n/2. "sqroot" means size is $\lfloor n^{1/2} \rfloor$ and "cuberoot" means size is $\lfloor n^{1/3} \rfloor$.
g	a function such that $E(g(x))$ is the quantity of interest. The default is NULL, which causes the identity function to be used.
r	The lugsail parameters (r) that converts a lag window into its lugsail equivalent. Larger values of r will typically imply less underestimation of "cov", but higher variability of the estimator. Default is r = 3 and r = 1, 2 are also good choices, but will likely underestimation of variance. r > 5 is not recommended.

method	any of "bm","obm","bartlett", "tukey". "bm" represents batch means estimator, "obm" represents overlapping batch means estimator with, "bartlett" and "tukey" represents the modified-Bartlett window and the Tukey-Hanning windows for spectral variance estimators.
warn	a logical value indicating whether the function should issue a warning if the sample size is too small (less than 1,000).

Value

mcse returns a list with three elements:

est	an estimate of $E(g(x))$.
se	the Monte Carlo standard error.
nsim	The number of samples in the input Markov chain.

mcse.q(x, 0.1, method = "obm")
mcse.q(x, 0.9, method = "obm")

# Estimate E(x^2) with MCSE using spectral methods.

g = function(x) { x^2 }
mcse(x, g = g, method = "tukey")
```

---

mcse.initseq	*Multivariate Monte Carlo standard errors for expectations with the initial sequence method of Dai and Jones (2017)*

Description

Function returns the estimate of the covariance matrix in the Markov Chain central limit theorem using initial sequence method. This method is designed to give an asymptotically conservative estimate of the Monte Carlo standard error.

Usage

```
mcse.initseq(x, g = NULL, adjust = FALSE, blather = FALSE)
```

Arguments

x	A matrix or data frame of Markov chain output. Number of rows is the Monte Carlo sample size.
g	A function that represents features of interest. g is applied to each row of x and thus g should take a vector input only. If g is NULL, g is set to be identity, which is estimation of the mean of the target density.
adjust	Logical; if TRUE, an adjustment is made to increase slightly the eigenvalues of the initial sequence estimator. The default is FALSE.
blather	if TRUE, outputs under the hood information about the function.

Value

A list is returned with the following components,

cov	a covariance matrix estimate using intial sequence method.
cov.adj	a covariance matrix estimate using adjusted initial sequence method if the input adjust=TRUE.
eigen_values	eigen values of the estimate cov.
method	method used to calculate matrix cov.

est   estimate of g(x).

nsim   number of rows of the input x. Only if `blather = TRUE`.

Adjustment_Used

                      logical of whether an adjustment was made to the initial sequence estimator.
                      Only if `blather = TRUE`.

[mcse](), which acts on a vector. [mcse.mat](), which applies mcse to each column of a matrix or data
frame. [mcse.q]() and [mcse.q.mat](), which compute standard errors for quantiles. mcse.multi, which
estimates the covariance matrix in the Markov Chain CLT using batch means or spectral variance
methods.

Examples

```
## Bivariate Normal with mean (mu1, mu2) and covariance sigma
n <- 1e3
mu <- c(2, 50)
sigma <- matrix(c(1, 0.5, 0.5, 1), nrow = 2)
out <- BVN_Gibbs(n, mu, sigma)

out.mcse <- mcse.initseq(x = out)
out.mcse.adj <- mcse.initseq(x = out, adjust = TRUE)

# If we are only estimating the mean of the first component,
# and the second moment of the second component
g <- function(x) return(c(x[1], x[2]^2))
out.g.mcse <- mcse.initseq(x = out, g = g)
```

---

mcse.mat   *Apply* mcse *to each column of the MCMC samples.*

Description

Apply `mcse` to each column of the MCMC samples.

Usage

```
mcse.mat(x, size = NULL, g = NULL, method = "bm", r = 3)
```

Arguments

x	a matrix of values from a Markov chain of size n x p.
size	represents the batch size in "bm" and the truncation point in "bartlett" and "tukey". Default is NULL which implies that an optimal batch size is calculated using the batchSize function. Can take character values of "sqroot" and "cuberoot" or any numeric value between 1 and n/2. "sqroot" means size is $\lfloor n^{1/2} \rfloor$ and "cuberoot" means size is $\lfloor n^{1/3} \rfloor$.
g	a function such that $E(g(x))$ is the quantity of interest. The default is NULL, which causes the identity function to be used.
method	any of "bm","obm","bartlett", "tukey". "bm" represents batch means estimator, "obm" represents overlapping batch means estimator with, "bartlett" and "tukey" represents the modified-Bartlett window and the Tukey-Hanning windows for spectral variance estimators.
r	The lugsail parameters (r) that converts a lag window into its lugsail equivalent. Larger values of r will typically imply less underestimation of "cov", but higher variability of the estimator. Default is r = 3 and r = 1,2 are also good choices although may lead to underestimates of the variance. r > 5 is not recommended.

Value

mcse.mat returns a matrix with ncol(x) rows and two columns. The row names of the matrix are the same as the column names of x. The column names of the matrix are "est" and "se". The jth row of the matrix contains the result of applying mcse to the jth column of x.

---

mcse.multi *Multivariate Monte Carlo standard errors for expectations.*

Description

Function returns the estimate of the covariance matrix in the Markov Chain CLT using batch means or spectral variance methods (with different lag windows). The function also returns the Monte Carlo estimate.

Usage

```
mcse.multi(x, method = "bm", r = 3, size = NULL, g = NULL,
                adjust = TRUE, blather = FALSE)
```

Arguments

x	A matrix or data frame of Markov chain output. Number of rows is the Monte Carlo sample size.
method	Any of "bm","obm","bartlett","tukey". "bm" represents batch means estimator, "obm" represents the overlapping batch means estimator, and "bartlett" and "tukey" represent the modified-Bartlett window and the Tukey-Hanning windows for the spectral variance estimators.
r	The lugsail parameters (r) that converts a lag window into its lugsail equivalent. Larger values of r will typically imply less underestimation of "cov", but higher variability of the estimator. Default is r = 3 and r = 1,2 are good choices. r > 5 is not recommended.
size	Represents the batch size in "bm" and the truncation point in "bartlett" and "tukey". Default is NULL which implies that an optimal batch size is calculated using the batchSize function. Can take character values of "sqroot" and "cuberoot" or any numeric value between 1 and n/2. "sqroot" means size is floor(n^(1/2)) and "cuberoot" means size is floor(n^(1/3)).
g	A function that represents features of interest. g is applied to each row of x and thus g should take a vector input only. If g is NULL, g is set to be identity, which is estimation of the mean of the target density.
adjust	Defaults to TRUE. logical for whether the matrix should automatically be adjusted if unstable.
blather	If TRUE, returns under-the-hood workings of the package.

Value

A list is returned with the following components,

cov	a covariance matrix estimate.
est	estimate of g(x).
nsim	number of rows of the input x.
eigen_values	eigen values of the estimate cov.
method	method used to calculate matrix cov.
size	value of size used to calculate cov.
Adjustment_Used	
	whether an adjustment was used to calculate cov.

---

mcse.q   *Compute Monte Carlo standard errors for quantiles.*

Description

Compute Monte Carlo standard errors for quantiles.

Usage

```
mcse.q(x, q, size = NULL, g = NULL, method = c("bm", "obm", "sub"), warn = FALSE)
```

Arguments

x	a vector of values from a Markov chain.
q	the quantile of interest.
size	the batch size. The default value is "sqroot", which uses the square root of the sample size. A numeric value may be provided if "sqroot" is not satisfactory.
g	a function such that the qth quantile of the univariate distribution function of $g(x)$ is the quantity of interest. The default is NULL, which causes the identity function to be used.
method	the method used to compute the standard error. This is one of "bm" (batch means, the default), "obm" (overlapping batch means), or "sub" (subsampling bootstrap).
warn	a logical value indicating whether the function should issue a warning if the sample size is too small (less than 1,000).

Value

`mcse.q` returns a list with three elements:

est	an estimate of the qth quantile of the univariate distribution function of $g(x)$.
se	the Monte Carlo standard error.
nsim	The number of samples in the input Markov chain.

mcse.q.mat	*Apply* mcse.q *to each column of a matrix or data frame of MCMC samples.*

Description

Apply mcse.q to each column of a matrix or data frame of MCMC samples.

Usage

```
mcse.q.mat(x, q, size = NULL, g = NULL, method = c("bm", "obm", "sub"))
```

Arguments

x	a matrix or data frame with each row being a draw from the multivariate distribution of interest.
q	the quantile of interest.
size	the batch size. The default value is "sqroot", which uses the square root of the sample size. "cuberoot" will cause the function to use the cube root of the sample size. A numeric value may be provided if "sqroot" is not satisfactory.
g	a function such that the qth quantile of the univariate distribution function of $g(x)$ is the quantity of interest. The default is NULL, which causes the identity function to be used.
method	the method used to compute the standard error. This is one of "bm" (batch means, the default), "obm" (overlapping batch means), or "sub" (subsampling bootstrap).

Value

mcse.q.mat returns a matrix with ncol(x) rows and two columns. The row names of the matrix are the same as the column names of x. The column names of the matrix are "est" and "se". The jth row of the matrix contains the result of applying mcse.q to the jth column of x.

minESS   *Minimum effective sample size required for stable estimation as de-*
                                scribed in Vats et al. (2015)

Description

The function calculates the minimum effective sample size required for a specified relative tolerance
level. This function can also calculate the relative precision in estimation for a given estimated
effective sample size.

Usage

```
minESS(p, alpha = .05, eps = .05, ess = NULL)
```

Arguments

p   dimension of the estimation problem.

alpha   Confidence level.

eps   Tolerance level. The eps value is ignored is ess is not NULL.

ess   Estimated effective sample size. Usually the output value from multiESS.

Details

The minimum effective samples required when estimating a vector of length p, with $100(1 - \alpha)\%$
confidence and tolerance of ϵ is

$$mESS \geq \frac{2^{2/p}\pi}{(p\Gamma(p/2))^{2/p}} \frac{\chi^2_{1-\alpha,p}}{\epsilon^2}.$$

The above equality can also be used to get ϵ from an already obtained estimate of mESS.

Value

By default function returns the minimum effective sample required for a given eps tolerance. If ess
is specified, then the value returned is the eps corresponding to that ess.

Examples

```
minESS(p = 5)
```

---

multiESS	*Effective Sample Size of a multivariate Markov chain as described in Vats et al. (2015).*

Description

Calculate the effective sample size of the Markov chain, using the multivariate dependence structure of the process.

Usage

```
multiESS(x, covmat = NULL, g = NULL, ...)
```

Arguments

x	a matrix or data frame of Markov chain output. Number of rows is the Monte Carlo sample size.
covmat	optional matrix estimate obtained using mcse.multi or mcse.initseq.
g	a function that represents features of interest. g is applied to each row of x and thus g should take a vector input only. If g is NULL, g is set to be identity, which is estimation of the mean of the target density.
...	arguments for mcse.multi function. Don't use this if a suitable matrix estimate from mcse.multi or mcse.initseq is already obtained.

Details

Effective sample size is the size of an iid sample with the same variance as the current sample. ESS is given by

$$ESS = n\frac{|\Lambda|^{1/p}}{|\Sigma|^{1/p}},$$

where Λ is the sample covariance matrix for g and Σ is an estimate of the Monte Carlo standard error for g.

Value

The function returns the estimated effective sample size.
