Package 'origin'

September 22, 2021

Type Package

Title Explicitly Qualifying Namespaces by Automatically Adding 'pkg::' to Functions

Version 0.5.3

Author Matthias Nistler

Maintainer Matthias Nistler <m_nistler@web.de>

Description Automatically adding 'pkg::' to a function, i.e. mutate() becomes dplyr::mutate(). It is up to the user to determine which packages should be used explicitly, whether to include base R packages or use the functionality on selected text, a file, or a complete directory. User friendly logging is provided in the 'RStudio' Markers pane. Lives in the spirit of 'lintr' and 'styler'.

 ${\tt get_exported_functions}$

Get All Exported Functions From a Package

Description

Get All Exported Functions From a Package

Usage

```
get_exported_functions(pkg)
```

Arguments

pkg

a character string of a package name

Value

character vector of functions names

Examples

```
get_exported_functions("base")
```

get_local_functions

Find All User Defined functions in the Project

Description

Find All User Defined functions in the Project

Usage

```
get_local_functions(path = ".")
```

Arguments

path

Path in which all defined function names should be found and retrieved. Defaults to the current working directory.

Value

character vector of function names

Examples

```
get_local_functions(path = ".")
get_local_functions(path = rstudioapi::getActiveProject())
```

```
get_pkgs_from_description
```

Get Packages from the DESCRIPTION file

Description

It looks for a DESCRIPTION file in the current project and returns all packages listed in Suggests, Imports, and Depends.

Usage

```
get_pkgs_from_description()
```

Value

character vector of package names

Examples

```
# Only works inside of a package developing project
## Not run:
get_pkgs_from_description()
## End(Not run)
```

4 originize_dir

originize_dir

Originize a complete directory

Description

To originize complete folders/projects, this function finds and originizes all R files within this folder and (by default) its subdirectories.

Usage

```
originize_dir(
  path = getwd(),
 pkgs = getOption("origin.pkgs", .packages()),
  recursive = TRUE,
 exclude_files = NULL,
  overwrite = getOption("origin.overwrite", TRUE),
 ask_before_applying_changes = getOption("origin.ask_before_applying_changes", TRUE),
  ignore_comments = getOption("origin.ignore_comments", TRUE),
  check_conflicts = getOption("origin.check_conflicts", TRUE),
  check_base_conflicts = getOption("origin.check_base_conflicts", TRUE),
  path_to_local_functions = getOption("origin.path_to_local_functions", NULL),
  check_local_conflicts = getOption("origin.check_local_conflicts", TRUE),
  add_base_packages = getOption("origin.add_base_packages", FALSE),
  excluded_functions = getOption("origin.excluded_functions", list()),
 verbose = getOption("origin.verbose", FALSE),
  use_markers = getOption("origin.use_markers_for_logging", TRUE)
)
```

Arguments

path	path to a directory. Defaults to the current working directory.		
pkgs	a character vector with package names. Defaults to the result of .packages but only if the option 'origin.pkgs' is not specified.		
recursive	logical. Should scripts be originized recursively, this means that all files in the subfolders will be searched as well. See list.files		
exclude_files	a character vector of file paths that should be excluded excluded from being originized. Helpful if all but a few files should be considered by origin.		
overwrite	if TRUE the file will be saved and overwritten. Otherwise, only the logging is triggered. Note that, depending on 'ask_before_applying_changes', the user is ask whether the result is as desired.		
ask_before_applying_changes			
	if TRUE, the user has to approve changes made by origin prior to applying them.		
ignore_comments			
	if TRUE, commented lines are ignored.		

originize_dir 5

check_conflicts

if TRUE, possible namespace conflicts between functions exported by packages listed in pkgs are checked. See details.

check_base_conflicts

if TRUE; native R functions are also included in checking for conflicts. See details.

path_to_local_functions

Path to search for local functions that mask all exported functions from originizing. If NULL, defaults to the current RStudio Project root.

check_local_conflicts

if TRUE, it is checked whether locally defined functions inside of the project mask exported functions packages listed in pkgs. It avoids mistakenly adding pkg:: to a custom local function.

add_base_packages

a boolean. If TRUE, base R functions are handled like all other packages and added via '::'

excluded_functions

a list. Either an unnamed list of function names as strings. These functions are excluded from all packages and never considered in origin. Or a named list with character vectors, Then the name of the list element refers to a package and the given functions are only excluded from this package. A very explicit way to handle namespace conflicts or highlighting popular infix functions like '%>%' or ':='.

verbose if TRUE, origin provides a logging output about its results.

use_markers a boolean. If TRUE, the markers tab inn RStudio is used to track changes and

show issues. FALSE prints the same information in the console.

Details

check_conflicts checks whether multiple packages listed in pkgs export functions with the same name, e.g. lag() is both part of the dplyr and data.table namespace. If there are any conflicts actually present in any considered script, these conflicts are shown including how origin would solve them. User input is required to proceed. The order in pkgs determines the precedence, while those listed first have higher precedence than those listed later in the vector. This is consistent with function masking in R.

check_base_conflicts checks whether functions listed in pkgs mask R functions of R core packages (base, utils, stats, methods, graphics, grDevices, datasets). Even tough the user might not include those functions in the pkg::fct logic, potential conflicts require careful evaluation.

Value

No return value, called for side effects

Examples

6 originize_file

originize_file

Originize a specific file

Description

Originize a specific file

Usage

```
originize_file(
    file,
    pkgs = getOption("origin.pkgs", .packages()),
    overwrite = getOption("origin.overwrite", TRUE),
    ask_before_applying_changes = getOption("origin.ask_before_applying_changes", TRUE),
    ignore_comments = getOption("origin.ignore_comments", TRUE),
    check_conflicts = getOption("origin.check_conflicts", TRUE),
    check_base_conflicts = getOption("origin.check_base_conflicts", TRUE),
    add_base_packages = getOption("origin.add_base_packages", FALSE),
    excluded_functions = getOption("origin.excluded_functions", list()),
    verbose = getOption("origin.verbose", FALSE),
    use_markers = getOption("origin.use_markers_for_logging", TRUE),
    path_to_local_functions = getOption("origin.path_to_local_functions", NULL),
    check_local_conflicts = getOption("origin.check_local_conflicts", TRUE)
)
```

Arguments

file a path to a script

pkgs a character vector with package names. Defaults to the result of .packages but

only if the option 'origin.pkgs' is not specified.

overwrite if TRUE the file will be saved and overwritten. Otherwise, only the logging is

triggered. Note that, depending on 'ask_before_applying_changes', the user is

ask whether the result is as desired.

ask_before_applying_changes

if TRUE, the user has to approve changes made by origin prior to applying them.

originize_file 7

ignore_comments

if TRUE, commented lines are ignored.

check_conflicts

if TRUE, possible namespace conflicts between functions exported by packages listed in pkgs are checked. See details.

check_base_conflicts

if TRUE; native R functions are also included in checking for conflicts. See details

add_base_packages

a boolean. If TRUE, base R functions are handled like all other packages and added via '::'

excluded_functions

a list. Either an unnamed list of function names as strings. These functions are excluded from all packages and never considered in origin. Or a named list with character vectors, Then the name of the list element refers to a package and the given functions are only excluded from this package. A very explicit way to handle namespace conflicts or highlighting popular infix functions like '%>%' or ':='.

verbose if TRUE, origin provides a logging output about its results.

use_markers a boolean. If TRUE, the markers tab inn RStudio is used to track changes and show issues. FALSE prints the same information in the console.

path_to_local_functions

Path to search for local functions that mask all exported functions from originizing. If NULL, defaults to the current RStudio Project root.

check_local_conflicts

if TRUE, it is checked whether locally defined functions inside of the project mask exported functions packages listed in pkgs. It avoids mistakenly adding pkg:: to a custom local function.

Details

check_conflicts checks whether multiple packages listed in pkgs export functions with the same name, e.g. lag() is both part of the dplyr and data.table namespace. If there are any conflicts actually present in any considered script, these conflicts are shown including how origin would solve them. User input is required to proceed. The order in pkgs determines the precedence, while those listed first have higher precedence than those listed later in the vector. This is consistent with function masking in R.

check_base_conflicts checks whether functions listed in pkgs mask R functions of R core packages (base, utils, stats, methods, graphics, grDevices, datasets). Even tough the user might not include those functions in the pkg::fct logic, potential conflicts require careful evaluation.

Value

No return value, called for side effects

8 originize_pkg

Examples

originize_pkg

Originize a Package Project

Description

It shares the functionality of originize_dir but is designed to be used within R-package projects.

Usage

```
originize_pkg(
  path = rstudioapi::getActiveProject(),
 pkgs = getOption("origin.pkgs", get_pkgs_from_description()),
  recursive = TRUE,
  exclude_files = NULL,
  overwrite = getOption("origin.overwrite", TRUE),
 ask_before_applying_changes = getOption("origin.ask_before_applying_changes", TRUE),
  ignore_comments = getOption("origin.ignore_comments", TRUE),
  check_conflicts = getOption("origin.check_conflicts", TRUE),
  check_base_conflicts = getOption("origin.check_base_conflicts", TRUE),
  add_base_packages = getOption("origin.add_base_packages", FALSE),
  excluded_functions = getOption("origin.excluded_functions", list()),
  verbose = getOption("origin.verbose", FALSE),
  use_markers = getOption("origin.use_markers_for_logging", TRUE),
 path_to_local_functions = getOption("origin.path_to_local_functions", NULL),
  check_local_conflicts = getOption("origin.check_local_conflicts", TRUE)
)
```

Arguments

path to the package project root by getActiveProject

pkgs a character vector of package names, defaults to packages mentioned in the DE-

SCRIPTION file if the option 'origin.pkgs' is not set.

originize_pkg 9

recursive logical. Should scripts be originized recursively, this means that all files in the

subfolders will be searched as well. See list.files

exclude_files a character vector of file paths that should be excluded excluded from being

originized. Helpful if all but a few files should be considered by origin.

overwrite if TRUE the file will be saved and overwritten. Otherwise, only the logging is

triggered. Note that, depending on 'ask_before_applying_changes', the user is

ask whether the result is as desired.

ask_before_applying_changes

if TRUE, the user has to approve changes made by origin prior to applying them.

 $ignore_comments$

if TRUE, commented lines are ignored.

check_conflicts

if TRUE, possible namespace conflicts between functions exported by packages listed in pkgs are checked. See details.

check_base_conflicts

if TRUE; native R functions are also included in checking for conflicts. See details.

add_base_packages

a boolean. If TRUE, base R functions are handled like all other packages and added via '::'

excluded_functions

a list. Either an unnamed list of function names as strings. These functions are excluded from all packages and never considered in origin. Or a named list with character vectors, Then the name of the list element refers to a package and the given functions are only excluded from this package. A very explicit way to handle namespace conflicts or highlighting popular infix functions like '%>%'

or ':='.

verbose if TRUE, origin provides a logging output about its results.

use_markers a boolean. If TRUE, the markers tab inn RStudio is used to track changes and

show issues. FALSE prints the same information in the console.

path_to_local_functions

Path to search for local functions that mask all exported functions from originizing. If NULL, defaults to the current RStudio Project root.

check_local_conflicts

if TRUE, it is checked whether locally defined functions inside of the project mask exported functions packages listed in pkgs. It avoids mistakenly adding pkg:: to a custom local function.

Details

check_conflicts checks whether multiple packages listed in pkgs export functions with the same name, e.g. lag() is both part of the dplyr and data.table namespace. If there are any conflicts actually present in any considered script, these conflicts are shown including how origin would solve them. User input is required to proceed. The order in pkgs determines the precedence, while those listed first have higher precedence than those listed later in the vector. This is consistent with function masking in R.

10 originize_selection

check_base_conflicts checks whether functions listed in pkgs mask R functions of R core packages (base, utils, stats, methods, graphics, grDevices, datasets). Even tough the user might not include those functions in the pkg::fct logic, potential conflicts require careful evaluation.

Value

No return value, called for side effects

Examples

originize_selection

Wrapper function to be used as an RStudio addin

Description

Wrapper function to be used as an RStudio addin

Usage

```
originize_selection(
  context = rstudioapi::getSourceEditorContext(),
  pkgs = getOption("origin.pkgs", .packages()),
  overwrite = getOption("origin.overwrite"),
  ask_before_applying_changes = getOption("origin.ask_before_applying_changes"),
  ignore_comments = getOption("origin.ignore_comments"),
  check_conflicts = getOption("origin.check_conflicts"),
  check_base_conflicts = getOption("origin.check_base_conflicts"),
  add_base_packages = getOption("origin.add_base_packages"),
  excluded_functions = getOption("origin.excluded_functions"),
  verbose = getOption("origin.verbose"),
  use_markers = getOption("origin.use_markers_for_logging"),
  path_to_local_functions = getOption("origin.path_to_local_functions"),
  check_local_conflicts = getOption("origin.check_local_conflicts")
)
```

originize_selection 11

Arguments

context information of marked editor section in RStudio

pkgs a character vector with package names. Defaults to the result of .packages but

only if the option 'origin.pkgs' is not specified.

overwrite if TRUE the file will be saved and overwritten. Otherwise, only the logging is

triggered. Note that, depending on 'ask_before_applying_changes', the user is

ask whether the result is as desired.

ask_before_applying_changes

if TRUE, the user has to approve changes made by origin prior to applying them.

ignore_comments

if TRUE, commented lines are ignored.

check_conflicts

if TRUE, possible namespace conflicts between functions exported by packages listed in pkgs are checked. See details.

check_base_conflicts

if TRUE; native R functions are also included in checking for conflicts. See details.

add_base_packages

a boolean. If TRUE, base R functions are handled like all other packages and added via '::'

excluded_functions

a list. Either an unnamed list of function names as strings. These functions are excluded from all packages and never considered in origin. Or a named list with character vectors, Then the name of the list element refers to a package and the given functions are only excluded from this package. A very explicit way to handle namespace conflicts or highlighting popular infix functions like '%>%'

or ':='.

verbose if TRUE, origin provides a logging output about its results.

use_markers a boolean. If TRUE, the markers tab inn RStudio is used to track changes and

show issues. FALSE prints the same information in the console.

path_to_local_functions

Path to search for local functions that mask all exported functions from originizing. If NULL, defaults to the current RStudio Project root.

check_local_conflicts

if TRUE, it is checked whether locally defined functions inside of the project mask exported functions packages listed in pkgs. It avoids mistakenly adding pkg:: to a custom local function.

Value

No return value, called for side effects
