# Package 'psycModel'

September 5, 2021

```
Type Package
```

Title Integrated Toolkit for Psychological Analysis and Modeling in R

Version 0.3.2

**Description** A beginner-friendly R package for modeling in psychology or related field. It allows fitting models, plotting, checking goodness of fit, and model assumption violations all in one place. It also produces beautiful and easy-to-read output.

License GPL (>= 3)

URL https://jasonmoy28.github.io/psycModel/

**Depends** R (>= 3.2)

**Imports** dplyr, ggplot2, glue, insight, lavaan, lifecycle, lme4, lmerTest, parameters, patchwork, performance, psych, rlang (>= 0.1.2), stringr, tibble, tidyr, utils

**Suggests** correlation, covr, cowplot, fansi, ggrepel, GPArotation, gridExtra, interactions, knitr, nFactors, nlme, pagedown, qqplotr, rmarkdown, roxygen2, sandwich, see, semPlot, testthat (>= 3.0.0), tidyselect

VignetteBuilder knitr

Config/testthat/edition 3

**Encoding UTF-8** 

LazyData true

RoxygenNote 7.1.1

NeedsCompilation no

# Description

### [Stable]

This function will run N number of CFA where N = length(group), and report the fit measures of CFA in each group. The function is intended to help you get a better understanding of which group has abnormal fit indicator

## Usage

```
cfa_groupwise(data, ..., group, model = NULL, ordered = FALSE)
```

### Arguments

data	data frame
	CFA items. Support dplyr::select() syntax.
group	character. group variable. Support dplyr::select() syntax.

cfa\_summary 3

model explicit lavaan model. Must be specify with model = lavaan\_model\_syntax.

[Experimental]
ordered logical. default is FALSE. If it is set to TRUE, lavaan will treat it as a ordinal

variable and use DWLS instead of ML

#### **Details**

All argument must be explicitly specified. If not, all arguments will be treated as CFA items

#### Value

data frame with group-wise CFA result

### **Examples**

```
# The example is used as the illustration of the function output only.
# It does not imply the data is appropriate for the analysis.
cfa_groupwise(
  data = lavaan::HolzingerSwineford1939,
  group = "school",
  x1:x3,
  x4:x6,
  x7:x9
)
```

cfa\_summary

Confirmatory Factor Analysis

### Description

#### [Stable]

The function fits a CFA model using the lavaan::cfa(). Users can fit single and multiple factors CFA, and it also supports multilevel CFA (by specifying the group). Users can fit the model by passing the items using dplyr::select() syntax or an explicit lavaan model for more versatile usage. All arguments (except the CFA items) must be explicitly named (e.g., model = your-model; see example for inappropriate behavior).

### Usage

```
cfa_summary(
  data,
    ...,
  model = NULL,
  group = NULL,
  ordered = FALSE,
  digits = 3,
  model_covariance = TRUE,
  model_variance = TRUE,
```

4 cfa\_summary

```
plot = TRUE,
  group_partial = NULL,
  streamline = FALSE,
  quite = FALSE,
  return_result = FALSE
)
```

data frame

print streamlined output suppress printing output

### **Arguments**

data

CFA items. Multi-factor CFA items should be separated by comma (as different argument). See below for examples. Support dplyr::select() syntax. mode1 explicit lavaan model. Must be specify with model = lavaan\_model\_syntax. [Experimental] group optional character, used for multi-level CFA, the nested variable for multilevel dataset (e.g., Country). Support dplyr::select() syntax. Default is FALSE. If it is set to TRUE, lavaan will treat it as a ordinal variable ordered and use DWLS instead of ML digits number of digits to round to model\_covariance print model covariance. Default is TRUE model\_variance print model variance. Default is TRUE print a path diagram. Default is TRUE plot Items for partial equivalence. The form should be  $c('DV = \sim item1', 'DV = \sim item1', 'DV = \sim item1')$ group\_partial item2').

### **Details**

streamline

return\_result

quite

First, just like researchers have argued against p value of 0.05 is not a good cut-of, researchers have also argue against that fit indicies (more importantly, the cut-off criteria) are not completely representative of the goodness of fit. Nonetheless, you are required to report them if you are publishing an article anyway. I will summarize the general recommended cut-off criteria for CFA model below. Researchers consider models with CFI (Bentler, 1990) that is > 0.95 to be excellent fit (Hu & Bentler, 1999), and > 0.9 to be acceptable fit. Researchers considered a model is excellent fit if CFI > 0.95 (Hu & Bentler, 1999), TLI > 0.95, SRMR < 0.08. The model is considered an acceptable fit if CFI > 0.9 and RMSEA < 0.08. I need some time to find all the relevant references, but this should be the general consensus.

If it is set to TRUE, it will return the lavaan model

#### Value

a lavaan object

compare\_fit 5

#### References

Hu, L., & Bentler, P. M. (1999). Cutoff criteria for fit indexes in covariance structure analysis: Conventional criteria versus new alternatives. Structural Equation Modeling, 6, 1–55. https://doi.org/10.1080/1070551990954011

### **Examples**

```
# REMEMBER, YOU MUST NAMED ALL ARGUMENT EXCEPT THE CFA ITEMS ARGUMENT
# Fitting a multilevel single factor CFA model
fit <- cfa_summary(</pre>
  data = lavaan::HolzingerSwineford1939,
  x1:x3,
  x4:x6,
  x7:x9,
  group = "sex",
  model_variance = FALSE, # do not print the model_variance
  model_covariance = FALSE # do not print the model_covariance
)
# Fitting a CFA model by passing explicit lavaan model (equivalent to the above model)
# Note in the below function how I added `model = ` in front of the lavaan model.
# Similarly, the same rule apply for all arguments (e.g., `ordered = FALSE` instead of just `FALSE`)
fit <- cfa_summary(</pre>
  model = "visual = x1 + x2 + x3; textual = x4 + x5 + x6;",
  data = lavaan::HolzingerSwineford1939,
  quite = TRUE # silence all output
## Not run:
# This will fail because I did not add `model = ` in front of the lavaan model.
# Therefore, you must add the tag in front of all arguments
# For example, `return_result = 'model'` instaed of `model`
cfa_summary("visual =^{\sim} x1 + x2 + x3
             textual =^{\sim} x4 + x5 + x6
             speed = ^{\sim} x7 + x8 + x9 ",
  data = lavaan::HolzingerSwineford1939
## End(Not run)
```

compare\_fit

Comparison of Model Fit

### **Description**

#### [Stable]

Compare the fit indices of models (see below for model support)

6 compare\_fit

#### Usage

```
compare_fit(
    ...,
    digits = 3,
    quite = FALSE,
    streamline = FALSE,
    return_result = FALSE
)
```

### **Arguments**

```
... model. If it is a lavaan object, it will try to compute the measurement invari-
ance. Other model types will be passed to performance::compare_performance().

digits number of digits to round to

quite suppress printing output

streamline print streamlined output

return_result If it is set to TRUE, it will return the the compare fit data frame.
```

#### Value

data frame with fit indices and change in fit indices

```
# lme model
fit1 <- lm_model(
  data = popular,
  response_variable = popular,
  predictor_var = c(sex, extrav)
)

fit2 <- lm_model(
  data = popular,
  response_variable = popular,
  predictor_var = c(sex, extrav),
  two_way_interaction_factor = c(sex, extrav)
)

compare_fit(fit1, fit2)

# see ?measurement_invariance for measurement invariance example</pre>
```

cor\_test 7

cor_test	Correlation table	

## Description

### [Stable]

This function uses the correlation::correlation() to generate the correlation table.

### Usage

```
cor_test(
  data,
  cols,
  ...,
  digits = 3,
  method = "pearson",
  p_adjust = "holm",
  streamline = FALSE,
  quite = FALSE,
  return_result = FALSE
)
```

## Arguments

data	data frame
cols	correlation items. Support dplyr::select() syntax.
	additional arguments passed to correlation::correlation(). See ?correlation::correlation. Note that the return data.frame from correlation::correlation() must contains r and p (e.g., passing baysesian = TRUE will not work)
digits	number of digits to round to
method	Default is "pearson". Options are "kendall", "spearman", "biserial", "polychoric", "tetrachoric", "biweight", "distance", "percentage", "blomqvist", "hoeffding", "gamma", "gaussian", "shepherd", or "auto". See ?correlation::correlation for detail
p_adjust	Default is "holm". Options are "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "somers" or "none". See ?stats::p.adjust for more detail
streamline	print streamlined output.
quite	suppress printing output
return_result	If it is set to TRUE, it will return the data frame of the correlation table

### Value

data frame of the correlation table

8 descriptive\_table

### **Examples**

```
cor_test(iris, where(is.numeric))
```

descriptive\_table

Descriptive Statistics Table

### Description

#### [Stable]

This function generates a table of descriptive statistics (mainly using psych::describe()) and or a correlation table. User can export this to a csv file (optionally, using the file\_path argument). Users can open the csv file with MS Excel then copy and paste the table into MS Word table.

### Usage

```
descriptive_table(
  data,
  cols,
  ...,
  digits = 3,
  descriptive_indicator = c("mean", "sd", "cor"),
  file_path = NULL,
  streamline = FALSE,
  quite = FALSE,
  return_result = FALSE
)
```

### **Arguments**

	data	data frame
	cols	$column(s) \ need \ to \ be \ included \ in \ the \ table. \ Support \ dplyr::select() \ syntax.$
		additional arguments passed to cor_test. See ?cor_test.
	digits	number of digit for the descriptive table
descriptive_indicator		licator
		Default is mean, sd, cor. Options are missing (missing value count), non_missing (non-missing value count), cor (correlation table), n, mean, sd, median, trimmed (trimmed mean), median, mad (median absolute deviation from the median), min, max, range, skew, kurtosis, se (standard error)
	file_path	file path for export. The function will implicitly pass this argument to the write.csv(file = file_path)
	streamline	print streamlined output
	quite	suppress printing output
	return_result	If it is set to TRUE, it will return the data frame of the descriptive table

efa\_summary 9

#### Value

data frame of the descriptive table

### **Examples**

```
descriptive_table(iris, cols = where(is.numeric)) # all numeric columns

descriptive_table(iris,
   cols = where(is.numeric),
    # get missing count, non-missing count, and mean & sd & correlation table
   descriptive_indicator = c("missing", "non_missing", "mean", "sd", "cor")
)
```

efa\_summary

**Exploratory Factor Analysis** 

### **Description**

#### [Stable]

The function is used to fit a exploratory factor analysis model. It will first find the optimal number of factors using parameters::n\_factors. Once the optimal number of factor is determined, the function will fit the model using psych::fa(). Optionally, you can request a post-hoc CFA model based on the EFA model which gives you more fit indexes (e.g., CFI, RMSEA, TLI)

### Usage

```
efa_summary(
  data,
  cols,
  rotation = "varimax",
  optimal_factor_method = FALSE,
  efa_plot = TRUE,
  digits = 3,
  n_factor = NULL,
  post_hoc_cfa = FALSE,
  quite = FALSE,
  streamline = FALSE,
  return_result = FALSE
)
```

### **Arguments**

```
data frame

cols columns. Support dplyr::select() syntax.

rotation the rotation to use in estimation. Default is 'oblimin'. Options are 'none', 'varimax', 'quartimax', 'promax', 'oblimin', or 'simplimax'
```

10 glme\_model

optimal\_factor\_method

Show a summary of the number of factors by optimization method (e.g., BIC,

VSS complexity, Velicer's MAP)

efa\_plot show explained variance by number of factor plot. default is TRUE.

digits number of digits to round to

n\_factor number of factors for EFA. It will bypass the initial optimization algorithm, and

fit the EFA model using this specified number of factor

post\_hoc\_cfa a CFA model based on the extracted factor

quite suppress printing output streamline print streamlined output

#### Value

a fa object from psych

### **Examples**

```
efa_summary(lavaan::HolzingerSwineford1939, starts_with("x"), post_hoc_cfa = TRUE)
```

glme\_model

Generalized Linear Mixed Effect Model

### **Description**

#### [Experimental]

Fit a generalized linear mixed effect model using lme4::glmer(). This function is still in early development stage.

### Usage

```
glme_model(
   data,
   model = NULL,
   response_variable,
   random_effect_factors = NULL,
   non_random_effect_factors = NULL,
   family,
   two_way_interaction_factor = NULL,
   three_way_interaction_factor = NULL,
   id,
   estimation_method = "REML",
   opt_control = "bobyqa",
   na.action = stats::na.omit,
   quite = FALSE
)
```

glme\_model 11

### **Arguments**

data data frame model 1me4 model syntax. Support more complicated model. Note that model summary will only return fixed effect estimates. This is not tested. [Experimental] response\_variable DV (i.e., outcome variable / response variable). Length of 1. Support dplyr::select() syntax. random\_effect\_factors random effect factors (level-1 variable for HLM people) Factors that need to estimate fixed effect and random effect (i.e., random slope / varying slope based on the id). Support dplyr::select() syntax. non\_random\_effect\_factors non-random effect factors (level-2 variable for HLM people). Factors only need to estimate fixed effect. Support dplyr::select() syntax. a GLM family. It will passed to the family argument in glmer. See ?glmer for family possible options. two\_way\_interaction\_factor two-way interaction factors. You need to pass 2+ factor. Support dplyr::select() syntax. three\_way\_interaction\_factor three-way interaction factor. You need to pass exactly 3 factors. Specifying three-way interaction factors automatically included all two-way interactions, so please do not specify the two\_way\_interaction\_factor argument. Support dplyr::select() syntax. id the nesting variable (e.g. group, time). Length of 1. Support dplyr::select() estimation\_method

character. ML or REML default to REML.

opt\_control character. default is bobyqa. See ?lme4::glmerControl for more options.

default is stats::na.omit. Another common option is na.exclude

quite suppress printing output

#### Value

An object of class glmerMod representing the linear mixed-effects model fit.

```
fit <- glme_model(
  response_variable = incidence,
  random_effect_factors = period,
  family = "poisson", # or you can enter as poisson(link = 'log')
  id = herd,
  data = lme4::cbpp
)</pre>
```

12 glm\_model

glm\_model

Generalized Linear Regression

### Description

### [Experimental]

Fit a generalized linear regression using glm(). This function is still in early development stage.

### Usage

```
glm_model(
  data,
  response_variable,
  predictor_variable,
  two_way_interaction_factor = NULL,
  three_way_interaction_factor = NULL,
  family,
  quite = FALSE
)
```

### **Arguments**

```
data
                  data frame
response_variable
                 response variable. Support dplyr::select() syntax.
predictor_variable
                 predictor variable. Support dplyr::select() syntax.
two_way_interaction_factor
                 two-way interaction factors. You need to pass 2+ factor. Support dplyr::select()
                 syntax.
three_way_interaction_factor
                 three-way interaction factor. You need to pass exactly 3 factors. Specifying
                 three-way interaction factors automatically included all two-way interactions,
                 so please do not specify the two_way_interaction_factor argument. Support
                 dplyr::select() syntax.
family
                 a GLM family. It will passed to the family argument in glmer. See ?glmer for
                 possible options.
                 suppress printing output
quite
```

### Value

an object class of glm representing the linear regression fit

html\_to\_pdf

#### **Examples**

```
fit <- glm_model(
  response_variable = incidence,
  predictor_variable = period,
  family = "poisson", # or you can enter as poisson(link = 'log'),
  data = lme4::cbpp
)</pre>
```

html\_to\_pdf

Convert HTML to PDF

### Description

#### [Experimental]

This is a helper function for knitting Rmd. Due to technological limitation, the output cannot knit to PDF in Rmd directly. It uses the pagedown::chrome\_print() in the backend. You must first knit to HTML, then you can use this function to covert them to PDF if you wish. I know this is a workaround to the issue, but the problem is with the latex engine printing unicode character. If you happen to know how to fix it, please let me know.

#### **Usage**

```
html_to_pdf(file_path = NULL, dir = NULL, scale = 1, render_exist = FALSE)
```

### Arguments

file\_path file path to the HTML file (can be relative if you are in a R project)

dir file path to the directory of all HTML files (can be relative if you are in a R

project)

scale the scale of the PDF

render\_exist overwrite exist PDF. Default is FALSE

#### Value

no return value

```
## Not run:
html_to_pdf(file_path = "html_name.html")
# all HTML files in the my_html_folder will be converted
html_to_pdf(dir = "Users/Desktop/my_html_folder")
## End(Not run)
```

```
integrated_model_summary
```

Integrated Function for Linear Regression

### **Description**

#### [Stable]

It will first compute the linear regression. Then, it will graph the interaction using the two\_way\_interaction\_plot or the three\_way\_interaction\_plot function. If you requested simple slope summary, it will calls the interaction::sim\_slopes()

### Usage

```
integrated_model_summary(
  data,
  response_variable = NULL,
  predictor_variable = NULL,
  two_way_interaction_factor = NULL,
  three_way_interaction_factor = NULL,
  family = NULL,
  cateogrical_var = NULL,
  graph_label_name = NULL,
 model_summary = TRUE,
  interaction_plot = TRUE,
  y_{lim} = NULL,
  plot_color = FALSE,
  digits = 3,
  simple_slope = FALSE,
  assumption_plot = FALSE,
  quite = FALSE,
  streamline = FALSE,
  return_result = FALSE
)
```

### **Arguments**

three\_way\_interaction\_factor three-way interaction factor. You need to pass exactly 3 factors. Specifying three-way interaction factors automatically included all two-way interactions, so please do not specify the two\_way\_interaction\_factor argument. Support dplyr::select() syntax. a GLM family. It will passed to the family argument in glm. See ?glm for family possible options. [Experimental] cateogrical\_var list. Specify the upper bound and lower bound directly instead of using ± 1 SD from the mean. Passed in the form of list(var\_name1 = c(upper\_bound1, lower\_bound1), var\_name2 = c(upper\_bound2,lower\_bound2)) graph\_label\_name optional vector or function. vector of length 2 for two-way interaction graph. vector of length 3 for three-way interaction graph. Vector should be passed in the form of c(response\_var, predict\_var1, predict\_var2, ...). Function should be passed as a switch function (see ?two\_way\_interaction\_plot for an example) print model summary. Required to be TRUE if you want assumption\_plot. model\_summary interaction\_plot generate the interaction plot. Default is TRUE y\_lim the plot's upper and lower limit for the y-axis. Length of 2. Example: c(lower\_limit, upper\_limit) plot\_color If it is set to TRUE (default is FALSE), the interaction plot will plot with color. digits number of digits to round to simple\_slope Slope estimate at +1/-1 SD and the mean of the moderator. Uses interactions::sim\_slope() in the background. assumption\_plot Generate an panel of plots that check major assumptions. It is usually recommended to inspect model assumption violation visually. In the background, it calls performance::check\_model() quite suppress printing output streamline print streamlined output

If it is set to TRUE (default is FALSE), it will return the model, model\_summary,

#### Value

return\_result

a list of all requested items in the order of model, model\_summary, interaction\_plot, simple\_slope

and plot (if the interaction term is included)

```
fit <- integrated_model_summary(
  data = iris,
  response_variable = "Sepal.Length",
  predictor_variable = tidyselect::everything(),
  two_way_interaction_factor = c(Sepal.Width, Species)
)</pre>
```

```
fit <- integrated_model_summary(
  data = iris,
  response_variable = "Sepal.Length",
  predictor_variable = tidyselect::everything(),
  two_way_interaction_factor = c(Sepal.Width, Species),
  simple_slope = TRUE, # you can request simple slope
  assumption_plot = TRUE, # you can also request assumption plot
  plot_color = TRUE # you can also request the plot in color
)</pre>
```

integrated\_multilevel\_model\_summary

Integrated Function for Mixed Effect Model

## Description

### [Stable]

It will first compute the mixed effect model. It will use either the nlme::lme or the lmerTest::lmer for linear mixed effect model. It will use lme4::glmer for generalized linear mixed effect model. Then, it will print the model summary and the panel of the plots that are useful for checking assumption (default is FALSE). If you requested the interaction plot (default is TRUE), it will graph the interaction (Currently only support lme model but not glme) If you requested simple slope summary, it will uses the interaction::sim\_slopes() to generate the slope estimate at varying level of the moderator (see ?simple\_slope for more detail)

### Usage

```
integrated_multilevel_model_summary(
  data,
 model = NULL,
  response_variable = NULL,
  random_effect_factors = NULL,
  non_random_effect_factors = NULL,
  two_way_interaction_factor = NULL,
  three_way_interaction_factor = NULL,
  family = NULL,
  cateogrical_var = NULL,
  id = NULL,
  graph_label_name = NULL,
  estimation_method = "REML",
  opt_control = "bobyqa",
  na.action = stats::na.omit,
 model_summary = TRUE,
  interaction_plot = TRUE,
  y_{lim} = NULL,
  plot_color = FALSE,
  digits = 3,
```

```
use_package = "lmerTest",
     simple_slope = FALSE,
     assumption_plot = FALSE,
     quite = FALSE,
     streamline = FALSE,
     return_result = FALSE
   )
Arguments
```

data data frame

mode1 1me4 model syntax. Support more complicated model structure from 1me4. It is not well-tested to ensure accuracy [Experimental]

response\_variable

DV (i.e., outcome variable / response variable). Length of 1. Support dplyr::select() syntax.

random\_effect\_factors

random effect factors (level-1 variable for HLM from a HLM perspective) Factors that need to estimate fixed effect and random effect (i.e., random slope / varying slope based on the id). Support dplyr::select() syntax.

non\_random\_effect\_factors

non-random effect factors (level-2 variable from a HLM perspective). Factors only need to estimate fixed effect. Support dplyr::select() syntax.

two\_way\_interaction\_factor

two-way interaction factors. You need to pass 2+ factor. Support dplyr::select() syntax.

three\_way\_interaction\_factor

three-way interaction factor. You need to pass exactly 3 factors. Specifying three-way interaction factors automatically included all two-way interactions, so please do not specify the two\_way\_interaction\_factor argument. Support dplyr::select() syntax.

family

a GLM family. It will passed to the family argument in glmer. See ?glmer for possible options. [Experimental]

cateogrical\_var

list. Specify the upper bound and lower bound directly instead of using  $\pm 1$  SD from the mean. Passed in the form of list(var\_name1 = c(upper\_bound1,lower\_bound1),var\_name2 = c(upper\_bound2,lower\_bound2))

id

the nesting variable (e.g. group, time). Length of 1. Support dplyr::select() syntax.

graph\_label\_name

optional vector or function. vector of length 2 for two-way interaction graph. vector of length 3 for three-way interaction graph. Vector should be passed in the form of c(response\_var, predict\_var1, predict\_var2, ...). Function should be passed as a switch function (see ?two\_way\_interaction\_plot for an example)

estimation\_method

character. ML or REML default is REML.

opt\_control default is optim for lme and bobyqa for lmerTest. default is stats::na.omit. Another common option is na.exclude na.action model\_summary print model summary. Required to be TRUE if you want assumption\_plot. interaction\_plot generate interaction plot. Default is TRUE y\_lim the plot's upper and lower limit for the y-axis. Length of 2. Example: c(lower\_limit,upper\_limit) plot\_color If it is set to TRUE (default is FALSE), the interaction plot will plot with color. number of digits to round to digits use\_package Default is 1merTest. Only available for linear mixed effect model. Options are nlme, lmerTest, or lme4('lme4 return similar result as lmerTest except the return model) Slope estimate at  $\pm 1$  SD and the mean of the moderator. Uses interactions::sim\_slope() simple\_slope in the background. assumption\_plot Generate an panel of plots that check major assumptions. It is usually recommended to inspect model assumption violation visually. In the background, it calls performance::check\_model(). quite suppress printing output streamline print streamlined output. return\_result If it is set to TRUE (default is FALSE), it will return the model, model\_summary, and plot (plot if the interaction term is included)

#### Value

a list of all requested items in the order of model, model\_summary, interaction\_plot, simple\_slope

```
fit <- integrated_multilevel_model_summary(</pre>
 data = popular,
 response_variable = popular,
 random_effect_factors = c(extrav),
 non_random_effect_factors = texp,
 two_way_interaction_factor = c(extrav, texp),
 graph_label_name = c("popular", "extraversion", "teacher experience"),
 id = class
)
fit <- integrated_multilevel_model_summary(</pre>
 data = popular,
 response_variable = popular,
  random_effect_factors = c(extrav, sex),
 non_random_effect_factors = texp,
 three_way_interaction_factor = c(extrav, sex, texp), # three-way interaction
 graph_label_name = c("popular", "extraversion", "sex", "teacher experience"),
 id = class,
 simple_slope = TRUE, # you can request simple slope
```

knit\_to\_Rmd

```
assumption_plot = TRUE, # you can also request assumption plot
plot_color = TRUE # you can also request the plot in color
)
```

knit\_to\_Rmd

Knit Rmd Files Instruction

### **Description**

This is a helper function that instruct users of the package how to knit a R Markdown (Rmd) files

### Usage

```
knit_to_Rmd()
```

#### Value

no return value

### **Examples**

```
knit_to_Rmd()
```

lme\_model

Linear Mixed Effect Model

### Description

### [Stable]

Fit a linear mixed effect model (i.e., hierarchical linear model, multilevel linear model) using the nlme::lme() or the lmerTest::lmer() function. Linear mixed effect model is used to explore the effect of continuous / categorical variables in predicting a normally distributed continuous variable.

### Usage

```
lme_model(
  data,
  model = NULL,
  response_variable,
  random_effect_factors = NULL,
  non_random_effect_factors = NULL,
  two_way_interaction_factor = NULL,
  three_way_interaction_factor = NULL,
  id,
```

20 lme\_model

```
estimation_method = "REML",
opt_control = "bobyqa",
na.action = stats::na.omit,
use_package = "lmerTest",
quite = FALSE
)
```

#### **Arguments**

data data frame

model lme4 model syntax. Support more complicated model. Note that model\_summary

will only return fixed effect estimates.

response\_variable

DV (i.e., outcome variable / response variable). Length of 1. Support dplyr::select()

syntax.

random\_effect\_factors

random effect factors (level-1 variable for HLM people) Factors that need to estimate fixed effect and random effect (i.e., random slope / varying slope based

on the id). Support dplyr::select() syntax.

 ${\tt non\_random\_effect\_factors}$ 

non-random effect factors (level-2 variable for HLM people). Factors only need to estimate fixed effect. Support dplyr::select() syntax.

two\_way\_interaction\_factor

two-way interaction factors. You need to pass 2+ factor. Support dplyr::select()

syntax.

three\_way\_interaction\_factor

three-way interaction factor. You need to pass exactly 3 factors. Specifying three-way interaction factors automatically included all two-way interactions, so please do not specify the two\_way\_interaction\_factor argument. Support

dplyr::select() syntax.

id the nesting variable (e.g. group, time). Length of 1. Support dplyr::select()

syntax.

estimation\_method

character. ML or REML default to REML.

opt\_control default is optim for lme and bobyqa for lmerTest

na.action default is stats::na.omit. Another common option is na.exclude

use\_package Default is 1merTest. Only available for linear mixed effect model. Options

are nlme, lmerTest, or lme4('lme4 return similar result as lmerTest except the

return model)

quite suppress printing output

#### **Details**

Here is a little tip. If you are using generic selecting syntax (e.g., contains() or start\_with()), you don't need to remove the response variable and the id from the factors. It will be automatically remove. For example, if you have x1:x9 as your factors. You want to regress x2:x8 on x1. Your

Im\_model 21

probably pass something like response\_variable = x1, random\_effect\_factors = c(contains('x'), x1) to the function. However, you don't need to do that, you can just pass random\_effect\_factors = c(contains('x')) to the function since it will automatically remove the response variable from selection.

#### Value

an object representing the linear mixed-effects model fit (it maybe an object from lme or lmer depending of the package you use)

### **Examples**

```
# two-level model with level-1 and level-2 variable with random intercept and random slope
fit1 <- lme_model(</pre>
 data = popular,
 response_variable = popular,
 random_effect_factors = c(extrav, sex),
 non_random_effect_factors = texp,
 id = class
)
# added two-way interaction factor
fit2 <- lme_model(</pre>
 data = popular,
 response_variable = popular,
 random_effect_factors = c(extrav, sex),
 non_random_effect_factors = texp,
 two_way_interaction_factor = c(extrav, texp),
 id = class
)
# pass a explicit lme model (I don't why you want to do that, but you can)
lme_fit <- lme_model(</pre>
 model = "popular ~ extrav*texp + (1 + extrav | class)",
 data = popular
)
```

lm\_model

Linear Regressions / ANOVA / ANCOVA

### **Description**

### [Stable]

Fit a linear regression using lm(). Linear regression is used to explore the effect of continuous variables / categorical variables in predicting a normally-distributed continuous variables. If you are using a categorical predictor to predict a continuous variable, some may call it a ANOVA / ANCOVA while it is just a special form of linear regression). In this package, I will not build separate function for ANOVA & ANCOVA since they are the same as linear regression

lm\_model

#### Usage

```
lm_model(
  data,
  response_variable,
  predictor_variable,
  two_way_interaction_factor = NULL,
  three_way_interaction_factor = NULL,
  quite = FALSE
)
```

### Arguments

```
data
                  data frame
response_variable
                  response variable. Support dplyr::select() syntax.
predictor_variable
                  predictor variable. Support dplyr::select() syntax. It will automatically re-
                 move the response variable from predictor variable, so you can use contains()
                  or start_with() safely.
two_way_interaction_factor
                 two-way interaction factors. You need to pass 2+ factor. Support dplyr::select()
three_way_interaction_factor
                 three-way interaction factor. You need to pass exactly 3 factors. Specifying
                  three-way interaction factors automatically included all two-way interactions,
                  so please do not specify the two_way_interaction_factor argument. Support
                  dplyr::select() syntax.
                  suppress printing output
quite
```

### Value

an object class of 1m representing the linear regression fit

```
fit <- lm_model(
  data = iris,
  response_variable = "Sepal.Length",
  predictor_variable = tidyselect::everything(),
  two_way_interaction_factor = c(Sepal.Width, Species)
)</pre>
```

measurement\_invariance

Measurement Invariance

### Description

#### [Stable]

Compute the measurement invariance model (i.e., measurement equivalence model) using multi-group confirmatory factor analysis (MGCFA; Jöreskog, 1971). This function uses the lavaan::cfa() in the backend. Users can run the configural-metric or the configural-metric-scalar comparisons (see below for detail instruction). All arguments (except the CFA items) must be explicitly named (like model = your-model; see example for inappropriate behavior).

### Usage

```
measurement_invariance(
  data,
    ...,
  model = NULL,
  group,
  ordered = FALSE,
  group_partial = NULL,
  invariance_level = "scalar",
  digits = 3,
  quite = FALSE,
  streamline = FALSE,
  return_result = FALSE
)
```

### **Arguments**

data	data frame	
•••	CFA items. Multi-factor CFA items should be separated by comma (as different argument). See below for examples. Support dplyr::select() syntax.	
model	<pre>explicit lavaan model. Must be specify with model = lavaan_model_syntax. [Experimental]</pre>	
group	the nested variable for multilevel dataset (e.g., Country). Support $dplyr::select()$ syntax.	
ordered	Default is FALSE. If it is set to TRUE, lavaan will treat it as a ordinal variable and use DWLS instead of ML	
group_partial	items for partial equivalence. The form should be $c('DV = \sim item1', 'DV = \sim item2')$ . See details for recommended practice.	
invariance_level		
	"metric" or "scalar". Default is 'metric'. Set as 'metric' for configural-metric comparison, and set as 'scalar' for configural-metric-scalar comparison.	

digits number of digits to round to

quite suppress printing output except the model summary.

streamline print streamlined output

return\_result If it is set to TRUE, it will return a data frame of the fit measure summary

#### **Details**

Chen (2007) suggested that change in CFI <= I-0.010l supplemented by RMSEA <= 0.015 indicate non-invariance when sample sizes were equal across groups and larger than 300 in each group (Chen, 2007). And, Chen (2007) suggested that change in CFI <= I-0.005l and change in RMSEA <= 0.010 for unequal sample size with each group smaller than 300. For SRMR, Chen (2007) recommend change in SRMR < 0.030 for metric-invariance and change in SRMR < 0.015 for scalar-invariance. For large group size, Rutowski & Svetina (2014) recommended a more liberal cut-off for metric non-invariance for CFI (change in CFI <= I-0.020l) and RMSEA (RMSEA <= 0.030). However, this more liberal cut-off DOES NOT apply to testing scalar non-invariance. If measurement-invariance is not achieved, some researchers suggesting partial invariance is acceptable (by releasing the constraints on some factors). For example, Steenkamp and Baumgartner (1998) suggested that ideally more than half of items on a factor should be invariant. However, it is important to note that no empirical studies were cited to support the partial invariance guideline (Putnick & Bornstein, 2016).

#### Value

a data frame of the fit measure summary

 data = lavaan::HolzingerSwineford1939
## End(Not run)
```

mediation\_summary

**Mediation Analysis** 

### Description

#### [Experimental]

It currently only support simple mediation analysis. In the backend, it called the lavaan::sem() model. I am trying to implement multilevel mediation in lavaan. In the future, I will try supporting moderated mediation (through lavaan or mediation) and mediation with latent variable (through lavaan).

#### Usage

```
mediation_summary(
  data,
  response_variable,
  mediator,
```

26 mediation\_summary

```
predictor_variable,
control_variable = NULL,
group = NULL,
standardize = TRUE,
digits = 3,
quite = FALSE,
streamline = FALSE,
return_result = FALSE
```

### **Arguments**

```
data frame
data
response_variable
                 response variable. Support dplyr::select() syntax.
                  mediator. Support dplyr::select() syntax.
mediator
predictor_variable
                  predictor variable. Support dplyr::select() syntax.
control_variable
                  control variables / covariate. Support dplyr::select() syntax.
group
                 nesting variable for multilevel mediation. Not confident about the implementa-
                  tion method. [Experimental]
standardize
                 standardized coefficients. Default is TRUE
                 number of digits to round to
digits
quite
                  suppress printing output
                 print streamlined output
streamline
return_result
                 If it is set to TRUE, it will return the lavaan object
```

#### Value

an object from lavaan

```
mediation_summary(
  data = lmerTest::carrots,
  response_variable = Preference,
  mediator = Sweetness,
  predictor_variable = Crisp
)
```

model\_summary 27

model\_summary

Model Summary for Regression Models

#### **Description**

#### [Stable]

The function will extract the relevant coefficients from the regression models (see below for supported model).

### Usage

```
model_summary(
  model,
  digits = 3,
  assumption_plot = FALSE,
  quite = FALSE,
  streamline = FALSE,
  return_result = FALSE
)
```

#### **Arguments**

model an model object. The following model are tested for accuracy: 1m, glm, 1me,

lmer, glmer. Other model object may work if it work with parameters::model\_parameters()

digits number of digits to round to

assumption\_plot

Generate an panel of plots that check major assumptions. It is usually recommended to inspect model assumption violation visually. In the background, it

calls performance::check\_model().

quite suppress printing output

streamline print streamlined output. Only print model estimate and performance.

#### Value

a list of model estimate data frame, model performance data frame, and the assumption plot (an ggplot object)

### References

#### **Examples**

```
# I am going to show the more generic usage of this function
# You can also use this package's built in function to fit the models
# I recommend using the integrated_multilevel_model_summary to get everything

# lme example
lme_fit <- lme4::lmer("popular ~ texp + (1 | class)",
    data = popular
)

model_summary(lme_fit)

# lm example

lm_fit <- lm(Sepal.Length ~ Sepal.Width + Petal.Length + Petal.Width,
    data = iris
)

model_summary(lm_fit, assumption_plot = TRUE)</pre>
```

popular

Popular dataset

#### **Description**

Classic data-set from Chapter 2 of Joop Hox's Multilevel Analysis (2010). The popular dataset included student from different class (i.e., class is the nesting variable). The outcome variable is a self-rated popularity scale. Individual-level (i.e., level 1) predictors are sex, extroversion. Class level (i.e., level 2) predictor is teacher experience.

### Usage

popular

### Format

A data frame with 2000 rows and 6 variables:

```
pupil Subject ID
popular Self-rated popularity scale ranging from 1 to 10
class the class that students belong to (nesting variable)
extrav extraversion scale (individual-level)
sex gender of the student (individual-level)
texp teacher experience (class-level)
```

#### Source

reliability\_summary 29

reliability\_summary Reliability Analysis

### **Description**

First, it will determine whether the data is uni-dimensional or multi-dimensional using parameters::n\_factors(). If the data is uni-dimensional, then it will print a summary consists of alpha, G6, single-factor CFA, and descriptive statistics result. If it is multi-dimensional, it will print a summary consist of alpha, G6, omega result. You can bypass this by specifying the dimensionality argument.

### Usage

```
reliability_summary(
  data,
  cols,
  dimensionality = NULL,
  digits = 3,
  descriptive_table = TRUE,
  quite = FALSE,
  streamline = FALSE,
  return_result = FALSE
)
```

#### **Arguments**

data data frame

cols items for reliability analysis. Support dplyr::select() syntax.

dimensionality Specify the dimensionality. Either uni (uni-dimensionality) or multi (multi-

dimensionality). Default is NULL that determines the dimensionality using EFA.

digits number of digits to round to

descriptive\_table

Get descriptive statistics. Default is TRUE

quite suppress printing output streamline print streamlined output

return\_result If it is set to TRUE (default is FALSE), it will return psych::alpha for unidimen-

sional scale, and psych:: omega for multidimensional scale.

#### Value

a psych::alpha object for unidimensional scale, and a psych::omega object for multidimensional scale.

```
fit <- reliability_summary(data = lavaan::HolzingerSwineford1939, cols = x1:x3)
fit <- reliability_summary(data = lavaan::HolzingerSwineford1939, cols = x1:x9)</pre>
```

30 simple\_slope

simple\_slope

Slope Estimate at Varying Level of Moderators

### **Description**

The function uses the interaction::sim\_slopes() to calculate the slope estimate at varying level of moderators (+/- 1 SD and mean). Additionally, it will produce a Johnson-Newman plot that shows when the slope estimate is not significant

### Usage

```
simple_slope(
  data,
  model,
  two_way_interaction_factor = NULL,
  three_way_interaction_factor = NULL)
```

#### **Arguments**

#### Value

a list with the slope estimate data frame and a Johnson-Newman plot.

```
fit <- lm_model(
  data = iris,
  response_variable = Sepal.Length,
  predictor_variable = tidyselect::everything(),
  three_way_interaction_factor = c(Sepal.Width, Petal.Width, Petal.Length)
)

simple_slope_fit <- simple_slope(
  data = iris,
  model = fit,
  three_way_interaction_factor = c("Sepal.Width", "Petal.Width", "Petal.Length")
)</pre>
```

```
three_way_interaction_plot
```

Three-way Interaction Plot

### **Description**

#### [Stable]

The function creates a two-way interaction plot. It will creates a plot with  $\pm 1$  SD from the mean of the independent variable. See below for supported model. I recommend using concurrently with  $lm_{model}()$ ,  $lm_{model}()$ .

#### Usage

```
three_way_interaction_plot(
  model,
  data = NULL,
  cateogrical_var = NULL,
  graph_label_name = NULL,
  y_lim = NULL,
  plot_color = FALSE
)
```

### **Arguments**

#### **Details**

It appears that "predict' cannot handle categorical factors. All variables are converted to numeric before plotting.

default if FALSE. Set to TRUE if you want to plot in color

### Value

```
a ggplot object
```

plot\_color

#### **Examples**

two\_way\_interaction\_plot

Two-way Interaction Plot

### **Description**

#### [Stable]

The function creates a two-way interaction plot. It will creates a plot with  $\pm$  1 SD from the mean of the independent variable. See supported model below. I recommend using concurrently with  $lm_{model}$  or  $lm_{model}$ .

### Usage

```
two_way_interaction_plot(
  model,
  data = NULL,
  graph_label_name = NULL,
  cateogrical_var = NULL,
  y_lim = NULL,
  plot_color = FALSE
)
```

### **Arguments**

model object from lm, nlme, lme4, or lmerTest

data frame. If the function is unable to extract data frame from the object, then

you may need to pass it directly

#### **Details**

It appears that "predict' cannot handle categorical factors. All variables are converted to numeric before plotting.

#### Value

an object of class ggplot

```
# If you pass the model directly, it can't extract the data-frame from fit object
# Therefore, for now, you must pass the data frame to the function.
# You don't need pass the data if you use `lm_model` or `lme_model`.
# lme example
lme_fit <- lme4::lmer("popular ~ extrav*texp + (1 + extrav | class)",</pre>
  data = popular
)
two_way_interaction_plot(lme_fit,
  graph_label_name = c("popular", "extraversion", "teacher experience"),
  data = popular
lm_fit <- lm(Sepal.Length ~ Sepal.Width * Petal.Width,</pre>
  data = iris
two_way_interaction_plot(lm_fit, data = iris)
# For more advanced users
label_name <- function(var_name) {</pre>
  var_name_processed <- switch(var_name,</pre>
    "extrav" = "Extroversion",
    "texp" = "Teacher Experience",
    "popular" = "popular"
  )
  if (is.null(var_name_processed)) {
    var_name_processed <- var_name</pre>
```

```
}
return(var_name_processed)
}
two_way_interaction_plot(lme_fit, data = popular, graph_label_name = label_name)
```
