Package 'randomLCA'

May 9, 2022

Type Package
Title Random Effects Latent Class Analysis
Version 1.1-2
Date 2022-05-08
Maintainer Ken Beath <ken@kjbeath.com.au></ken@kjbeath.com.au>
<pre>Contact Ken Beath <ken@kjbeath.com.au></ken@kjbeath.com.au></pre>
Author Ken Beath [aut, cre]
Description Fits standard and random effects latent class models. The single level random effects model is described in Qu et al <doi:10.2307 2533043=""> and the two level random effects model in Beath and Heller <doi:10.1177 1471082x0800900302="">. Examples are given for their use in diagnostic testing.</doi:10.1177></doi:10.2307>
Depends $R(>=3.2.0)$, lattice

AIC

AIC for randomLCA object

Description

Returns AIC for a randomLCA object.

Usage

```
## S3 method for class 'randomLCA'
AIC(object, ..., k = 2)
```

Arguments

object randomLCA object
... additional argument; currently none is used.
k penalty per parameter

Value

AIC

AIC3

Author(s)

Ken Beath

Examples

```
pap.lca2 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 2, cores = 1)
print(AIC(pap.lca2))</pre>
```

AIC3

AIC with 3 penalty for randomLCA object

Description

Returns AIC with penalty 3 for a randomLCA object.

Usage

AIC3(object)

Arguments

object

randomLCA object

Value

AIC3.

Author(s)

Ken Beath

```
pap.lca2 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 2, cores = 1)
print(AIC3(pap.lca2))</pre>
```

4 calcCond2Prob

BIC

BIC for randomLCA object

Description

Returns BIC for a randomLCA object.

Usage

```
## S3 method for class 'randomLCA'
BIC(object, ...)
```

Arguments

object randomLCA object

... additional argument; currently none is used.

Value

BIC

Author(s)

Ken Beath

Examples

```
pap.lca2 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 2, cores = 1)
print(BIC(pap.lca2))</pre>
```

calcCond2Prob

Calculate Conditional Outcome Probabilities for 2 Level Models

Description

The conditional probabilities are obtained integrating over the period random effect.

Usage

```
calcCond2Prob(object, conditionalp = 0.5)
```

Arguments

object RandomLCA object

conditionalp the percentiles for the random effect

calcCondProb 5

Value

Returns a data frame containing class, block, outcome, outcome (outcome probability) and perc (percentiles of the random effect) if conditionalp is specified. For example a conditionalp of 0.5 is the 50th percentile or the median corresponding to a random effect of zero. 0.025 and 0.975 correspond to the 2.5th and 97.5th percential, so the region between them if 95% of the variation in the data.

Author(s)

Ken Beath < kenbeath@mq.edu.au>

Examples

```
symptoms.lca2random2 <- randomLCA(symptoms[, 1:16], freq = symptoms$Freq,
random = TRUE, level2 = TRUE, nclass = 2, level2size = 4, constload = FALSE, cores = 1)
print(calcCond2Prob(symptoms.lca2random2))</pre>
```

calcCondProb

Calculate Conditional Outcome Probabilities

Description

Calculates the conditional outcome probabilities for random effects models or for standard latent class returns the outcome probabilities. For random effects, the outcome probabilities may be calculated for various percentiles of the random effect.

Usage

```
calcCondProb(object, conditionalp = 0.5)
```

Arguments

object RandomLCA object

conditionalp the percentiles for the random effect

Value

Returns a data frame containing class, block, outcome, outcome probability) and perc (percentiles of the random effect) if conditionalp is specified. For example a conditionalp of 0.5 is the 50th percentile or the median corresponding to a random effect of zero. 0.025 and 0.975 correspond to the 2.5th and 97.5th percential, so the region between them if 95% of the variation in the data.

Author(s)

Ken Beath < ken.beath@mq.edu.au>

6 calcMargProb

Examples

```
dentistry.lcarandom <- randomLCA(dentistry[, 1:5], freq = dentistry$freq,
random = TRUE, probit = TRUE, cores = 1)
print(calcCondProb(dentistry.lcarandom))</pre>
```

calcMargProb

Calculates Marginal Outcome Probabilities

Description

Calculates the marginal outcome probabilities for a random effects latent class model, by integrating the outcome probability over the random effect. This is performed using Gauss-Hermite quadrature with the number of quadrature points specified for the model fitting.

Usage

```
calcMargProb(object)
```

Arguments

object

randomLCA object

Value

Returns a data frame containing class, block, outcome, outcome (outcome probability).

Author(s)

Ken Beath

```
dentistry.lcarandom <- randomLCA(dentistry[, 1:5], freq = dentistry$freq,
random = TRUE, probit = TRUE, cores = 1)
print(calcMargProb(dentistry.lcarandom))</pre>
```

classProbs 7

classProbs

Determines class probabilities for fitted model

Description

The class probabililities for the model are returned.

Usage

```
classProbs(object)
```

Arguments

object

randomLCA object

Details

Simply extracts the corresponding variable from the randomLCA object.

Value

A vector of class probabilities for each class.

Author(s)

Ken Beath

Examples

```
pap.lca2 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 2, cores = 1)
print(classProbs(pap.lca2))</pre>
```

dentistry

Dental X-ray data

Description

Six dentists evaluated dental x-rays for incipient caries in Handelman et al (1986), data consistss of 5 of the dentists analysed by Espeland and Handelman (1989) using a latent class model. Further analysis incorprating a random effects latent class model by Qu et al (1996), and by Albert and Dodd (2004)

Usage

dentistry

8 dentistry

Format

A data frame with 32 observations on the following 6 variables.

```
V1 Dentist 1
```

V2 Dentist 2

V3 Dentist 3

V4 Dentist 4

V5 Dentist 5

freq Number of subjects

```
# fit LCR model from Qu et al (1996)
dentistry.lca <- randomLCA(dentistry[, 1:5], freq = dentistry$freq, cores = 1)
# start with constant laoding
dentistry.lcarandom <- randomLCA(dentistry[, 1:5], freq = dentistry$freq,
random = TRUE, probit = TRUE, cores = 1)
# allow loading to vary by dentist
dentistry.lcarandomunequal <- randomLCA(dentistry[, 1:5], freq = dentistry$freq,
random = TRUE, constload = FALSE, probit = TRUE, cores = 1)</pre>
```

fitted 9

fitted

fitted values

Description

Extract fitted values for randomLCA object.

Usage

```
## S3 method for class 'randomLCA'
fitted(object, ...)
```

Arguments

object randomLCA object

... additional argument; currently none is used.

Value

A data frame. The first columns of the data frame correspond to the patterns, followed by the frequency of each pattern, and then the fitted number for each pattern.

Author(s)

Ken Beath < ken.beath@mq.edu.au>

Examples

```
dentistry.lcarandom <- randomLCA(dentistry[, 1:5], freq = dentistry$freq,
random = TRUE, probit = TRUE, cores = 1)
print(fitted(dentistry.lcarandom))</pre>
```

genderrole

Gender Role Opinion Items

Description

Opinions collected on gender roles in a study by Felling et al (1987). This was originally published in Heinen (1996) and subsequently in Galindo Garre and Vermunt (2006).

Usage

```
genderrole
```

10 genderrole

Format

A data frame with 16 observations on the following 5 variables.

- Q1 Women's liberation sets women against men.
- Q2 It's better for a wife not to have a job because that always poses problems in the household, especially if there are children.
- Q3 The most natural situation occurs when the man is the breadwinner and the woman runs the household and takes care of the children.
- Q4 It isn't really as important for a girl to get a good education as it is for a boy.
- Q5 A woman is better suited to raise small children than a man.

# no improvement in fit
print(c(BIC(genderrole.lca1random2), BIC(genderrole.lca2random2),
BIC(genderrole.lca3random2)))</pre>
```

hivtests

HIV testing data

Description

Serum samples are tested for HIV by 4 different biossays in Alvord et al (1988) and sensitivity and specificity determined using latent class analysis. Qu et al (1996) repeat the analysis using a model incorporating a random effect.

Usage

hivtests

Format

A data frame with 16 observations on the following 5 variables.

V1 Test 1

V2 Test 2

V3 Test 3

V4 Test 4

12 logLik

Examples

logLik

log Likelikelihood for randomLCA object

Description

Returns log Likelihood for a randomLCA object.

Usage

```
## S3 method for class 'randomLCA'
logLik(object, ...)
```

Arguments

object randomLCA object
... additional argument; currently none is used.

Value

The loglikelihood.

Author(s)

Ken Beath

```
pap.lca2 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 2, cores = 1)
print(logLik(pap.lca2))</pre>
```

maxPostClass 13

maxPostClass	Determines class with maximum posterior class probability for each observation

Description

For each observation the posterior class probability is determined for each class, and then the class with the maximum posterior class probability is returned.

Usage

```
maxPostClass(object)
```

Arguments

object randomLCA object

Details

Returns the class with the maximum posterior class probability for each observation.

Value

A data frame. The first columns of the data frame correspond to the patterns, followed by the frequency of each pattern, and then the class with the maximum posterior class probability. The returned result is for the summarised data. If raw data is used, that is no frequencies, and it is required to calculated the posterior class probability for each observation then it is simply required to merge the maximum class with the raw data, possibly removing any variable "Freq" in the raw data.

Author(s)

Ken Beath

```
pap.lca2 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 2, cores = 1)
maxClass.lca2 <- maxPostClass(pap.lca2)
names(maxClass.lca2)[length(names(maxClass.lca2))] <- "maxProb.lca2"

pap.lca3 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 3, cores = 1)
maxClass.lca3 <- maxPostClass(pap.lca3)
names(maxClass.lca3)[length(names(maxClass.lca3))] <- "maxProb.lca3"

maxClass <- merge(maxClass.lca2, maxClass.lca3)
# aggregate because there is more than one record for each combination
# shows the relationship between the 2 and 3 class models
print(aggregate(maxClass$Freq, list(maxProb2 = maxClass$maxProb.lca2,</pre>
```

14 myocardial

```
maxProb3 = maxClass$maxProb.lca3), sum))
```

myocardial

Myocardial Infarction (MI)

Description

Four tests were performed on hospital patients to determine if a myocardial infarction had occurred.

Usage

myocardial

Format

A data frame with 32 observations on the following 6 variables.

Q.wave result from ECG test

History clinical history

LDH flipped, enzyme related to tissue breakdown

CPK high, creatine kinase or creatine phosphokinase, related to muscle damage

freq Number of subjects

```
# fit 2 class model from Rindskopf and Rindskopf (1986)
myocardial.lca2 <- randomLCA(myocardial[, 1:4], freq = myocardial$freq, cores = 1)</pre>
```

outcomeProbs 15

outcomeProbs	Extract outcome probabilities for randomLCA object	

Description

Extract outcome probabilities and confidence intervals for a randomLCA object.

Usage

```
## S3 method for class 'randomLCA'
outcomeProbs(object, level = 0.95, boot = FALSE, type = "perc",
    R = 999, scale = c("prob", "raw"), cores = max(detectCores() - 1, 1), ...)
```

Arguments

object	randomLCA object
level	confidence interval
boot	use parametric bootstrap to obtain confidence interval
type	type of bootstrap confidence intervals to use, with "perc" or "norm" valid, see boot.ci for description.
R	replications for parametric bootstrap
scale	either "prob" where probabilities are returned, the default, or "raw" where the probabilities are returned on the logit or probit scale, depending on which scale was selected in the textttrandomLCA function
cores	number of cores to use when bootstrapping, shuld be at least 1 less than available cores
	additional argument; currently none is used.

Details

Confidence intervals are calculated based on asymptotic normality of the estimates transformed by either the inverse of the probit or logistic, or using parametric bootstrap. The asymptotic confidence intervals are currently only available for models without random effects. For the confidence intervals obtained from the parametric bootstrap, the bootstrap is performed on the data that has been transformed to the logit or probit scale, as appropriate.

Value

Data frame consisting of outcome probabilities and confidence intervals. One for each class.

Author(s)

Ken Beath

16 pap

Examples

```
# standard latent class with 2 classes
dentistry.lca2 <- randomLCA(dentistry[, 1:5], freq = dentistry$freq, nclass = 2, cores = 1)
print(outcomeProbs(dentistry.lca2))
# print on the default logit scale
print(outcomeProbs(dentistry.lca2, scale = "raw"))
# convert back to probabilities
print(1.0/(1.0+exp(-outcomeProbs(dentistry.lca2, scale = "raw")[[1]])))
print(1.0/(1.0+exp(-outcomeProbs(dentistry.lca2, scale = "raw")[[2]])))</pre>
```

pap

Positive Action program implementation

Description

The Positive Action program is a series of interventions designed to reduce negative behaviours in elementary-school students. In a study in Hawaii (Beets et al, 2006) information was recorded from students in the treatment group about whether the various parts of the program were implemented. While it is useful to describe the proportion of students experiencing implementation of each part of the program, latent class analysis will reveal if there are specific patterns to the implementation of the program (Alcock, 2008).

Usage

pap

Format

A data frame with 606 observations summarising the answers for 1566 students on the following 11 variables. For each variable the data has been dichotomized so that a 0 represents no implementation and a 1 represents some implementation.

- Q1 you receive stickers from your teacher for doing positive actions?
- Q2 you receive a word of the week card from your teacher?
- 03 you put notes in an icu box?
- Q4 your teacher read notes about you from the icu box?
- Q5 your teacher read your notes from the icu box?
- Q6 your class receive a token for meeting your classroom goals?
- Q7 you participate in a positive action assembly?
- Q8 your class receive a balloon in an assembly for achieving their classroom goals?
- Q9 your class participate in whole school positive action celebrations?
- Q10 most weeks were you taught a positive action lesson?

plot

Plot a randomLCA object

Description

Plots the outcome probabilities for a randomLCA object, for random effects objects this can be either marginal or conditional or both. For a 2 level random effects model conditional2 will condition on the subject random effect and integrate over the period random effects. Note that plot is based on the xyplot function.

Usage

additional parameters to xyplot

Arguments

x randomLCA object
graphtype Type of graph

conditionalp For a conditional graph the percentile corresponding to the random effect at which the outcome probability is to be calculated

classes to be plotted across the page

```

postClassProbs

Determines posterior class probabilities for fitted model

Description

The posterior class probabililities for each observed pattern and class is determined. These are returned as a data frame together with the patterns for each observation. If class = 0 is requested then all classes are returned, otherwise only the selected class.

Usage

```
postClassProbs(object, class = 0)
```

Arguments

object randomLCA object

class class to be returned. Zero returns all classes.

Details

Extracts the corresponding data from the randomLCA object.

Value

A data frame. The first columns of the data frame correspond to the patterns, followed by the frequency of each pattern, and then the posterior class probabilities for either the selected class or for all classes. The returned result is for the summarised data. If raw data is used, that is no frequencies, and it is required to calculated the posterior class probability for each observation then it is simply required to merge the class probabilities with the raw data, possibly removing any variable "freq" in the raw data.

print(postClassProbs(pap.lca2))</pre>
```

20 randomLCA

print.randomLCA

print for randomLCA object

Description

Prints a randomLCA object. Prints summary.

Usage

```
## S3 method for class 'randomLCA'
print(x, ...)
```

Arguments

x randomLCA object

additional argument; currently none is used.

Author(s)

Ken Beath

Examples

```
pap.lca1 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 1, cores = 1)
pap.lca1
# or
print(pap.lca1)</pre>
```

randomLCA

Fits a Latent Class Model including a Random Effect

Description

Fit latent class models, which may include a random effect.

Usage

```
randomLCA(patterns, freq = NULL, nclass = 2, calcSE = TRUE, notrials = 20,
  random = FALSE, byclass = FALSE, quadpoints = 21, constload = TRUE,
  blocksize = dim(patterns)[2], level2 = FALSE, probit = FALSE,
  level2size = blocksize, quiterations = 5, penalty = 0.01, EMtol = 1.0e-5,
  verbose = FALSE, seed = as.integer(runif(1, 0, .Machine$integer.max)),
  cores = max(detectCores() %/% 2, 1))
```

randomLCA 21

Data frame or matrix of 0 and 1 defining the outcome patterns. May also include missing values, with randomLCA using maximum likelihood to fit the models

Arguments

patterns

	using all available data.
freq	Frequency for each outcome pattern, if missing this is calculated from the patterns, and the patterns are summarised to remove duplicate values.
nclass	Number of classes to be fitted
calcSE	Calculate standard errors for parameters. Useful for bootstrapping.
notrials	For a standard latent class model, the number of random starting values used
random	Include random effect?
byclass	Vary random effect loading(s) by class?
quadpoints	Number of quadrature points for adaptive quadrature
constload	Outcome loadings are constant for random effects model?
blocksize	Where a random effects (single level) model is broken into blocks, that is the loadings are repeated, this defines the size of the blocks
probit	Probit model for random effect?
level2	Fit 2 level random effects model (further details to follow)?

level2size Size of level 2 blocks if fitting 2 level models

quiterations Number of Quasi-Newton iterations within each EM/adaptive cycle. Decrease

if there is a failure to converge

penalty penalty applied to likelihood for outcome probabilities. Shrinks outcome prob-

abilities in slightly and can prevent extreme values. Setting penalty to 0 will

produce an unpenalized fit.

EMtol convergence tolerance for EM algorithm for fixed effect latent class

verbose Prints fit progress if true

seed Initial random seed for generating starting values. This can be set to guarantee

that the fit is the same each time, including the order of the classes.

cores Number of cores to be used for parallel evaluation of starting values

Details

The structure of the patterns is assumed to be a number of blocks of different outcomes each of level2size, allowing outcomes to be repeated. Each outcome is assumed to have it's own loading. An example is the width of the patterns is n and the level2size is n, resulting in n outcomes and therefore n loadings. Alternatively if the level2size is 1, then there are n repeats of the same outcome (but with different probabilities) with the same loading. In practice they may not be the same type of outcome, but usually will be.

The algorithm used is EM for the standard latent class and adaptive (in the sense of moving the location of the quadrature points) Gauss-Hermite quadrature for the random effects models. The number of quadrature points defaults to 21.

22 randomLCA

Value

randomLCA object This contains

fit Fit object from optim
nclass Number of classes
classp Class probabilities
outcomep Outcome probability

lambdacoef Loadings

se Standard errors corresponding to results returned by optim

np Number of parameters

nobs Number of observations in total logLik log likelihood for fitted model

penlogLik Penalised log likelihood for fitted model

observed Observed numbers corresponding to each pattern fitted Fitted number corresponding to each pattern

deviance Deviance

classprob Posterior class probability for each pattern

bics BIC obtained for each trial when fitting initial latent class models

call call to randomLCA

random random parameter to randomLCA constload constload parameter to randomLCA level2 level2 parameter to randomLCA level2size level2size parameter to randomLCA byclass byclass parameter to randomLCA probit probit parameter to randomLCA quadpoints quadpoints parameter to randomLCA blocksize blocksize parameter to randomLCA

freq frequency of each pattern

qniterations qniterations parameter to randomLCA penalty parameter to randomLCA

Note

In the returned object there a fields for patterns and frequencies. If frequencies are not supplied then the patterns and frequencies are constructed. If frequencies are supplied then zero rows are removed. When frequencies are supplied it is assumed that the data has been simplified. The returned fitted, posterior class probabilities etc, all correspond to the simplified patterns, not to the original data.

Examples

```
# standard latent class with 2 classes
dentistry.lca2 <- randomLCA(dentistry[, 1:5], freq = dentistry$freq, nclass = 2, cores = 1)
# random effects model with constant random effect loading
dentistry.lca2random <- randomLCA(dentistry[, 1:5], freq = dentistry$freq,
nclass = 2, random = TRUE, constload = TRUE, probit = TRUE, cores = 1)
# allow loading to vary by dentist
# this is the 2LCR model from Qu et al (1996)
dentistry.lca2random1 <- randomLCA(dentistry[, 1:5], freq = dentistry$freq,
nclass = 2, random = TRUE, constload = FALSE, probit = TRUE, cores = 1)</pre>
```

ranef

Extract random effects from a randomLCA object

Description

Extracts the Empirical Bayes estimates of the random effects.

Usage

```
## S3 method for class 'randomLCA'
ranef(object, ...)
```

Arguments

```
object randomLCA object with a random effect additional argument; currently none is used.
```

Value

A matrix with the first column containing the random effects and the second column the standard error of the random effects.

Author(s)

Ken Beath

```
pap.lca2random <- randomLCA(pap[, 1:10], freq = pap$Freq, random = TRUE, nclass = 2, cores = 1)
print(ranef(pap.lca2random))</pre>
```

24 refit

mo.f:+	Doft an usu dam I CA object	
refit	Refit an randomLCA object	

Description

Refits an randomLCA object using new data. This is useful when fitting simulated data, for example using a bootstrap.

Usage

```
## S3 method for class 'randomLCA'
refit(object, newpatterns, newfreq, useinit = FALSE, ...)
```

Arguments

object randomLCA object

newpatterns the new patterns that are to be fitted using the existing model

newfreq the frequencies corresponding to the patterns if required

useinit use initial values from randomLCA object

additional argument; currently none is used.

Details

The useunit parameter determines whether the parameter estimates from the supplied model are used as initial values or whether the complete model fitting process is repeated. If the initial values are used then fitting will be faster, and the fitted classes will be similar to those in the original model. If the data was not generated from the original model there is an increased risk that the fit will not find the global maxima. For this reason when performing a bootstrap Likelihood ratio test it is better to use useinit = FALSE. However when using useinit = FALSE there may be label switching, where the estimated classes are similar, but in a different order. Unless the estimated parameters are assigned to the correct classes this will invalidate the results of a parametric bootstrap for parameter confidence intervals.

Value

The fitted model to the new data.

Ken Beath

simulate 25

Examples

```
myocardial.lca1 <- randomLCA(myocardial[, 1:4], freq = myocardial$freq, nclass = 1, cores = 1)</pre>
myocardial.lca2 <- randomLCA(myocardial[, 1:4], freq = myocardial$freq, cores = 1)</pre>
# calculate observed lrt
obslrt <- 2*(logLik(myocardial.lca2)-logLik(myocardial.lca1))</pre>
print(obslrt)
nsims <- 999
# generate the simulations
thesims <- simulate(myocardial.lca1, nsims)</pre>
# for each simulation determin lrt
simlrt <- rep(NA, nsims)</pre>
for (isim in 1:nsims) {
 submodel <- refit(myocardial.lca1, newpatterns = thesims[[isim]])</pre>
 fullmodel <- refit(myocardial.lca2, newpatterns = thesims[[isim]])</pre>
 simlrt[isim] <- 2*(logLik(fullmodel)-logLik(submodel))</pre>
 print(c(isim, simlrt[isim]))
# calculate p value as proportion of simulated lrt greater than observed,
# corrected by adding one to numerator and denominator
print((sum(simlrt >= obslrt)+1)/(nsims+1))
```

simulate

Simulate

Description

Simulate data from a fitted randomLCA model

Usage

```
## S3 method for class 'randomLCA'
simulate(object, nsim, seed, ...)
```

Arguments

object randomLCA object

nsim number of data sets to be simulated

seed random seed

... additional optional arguments.

Details

Generates random data from the supplied object.

Value

A simulated data frame or a list of simulated data frames.

Author(s)

Ken Beath

Examples

```
myocardial.lca1 <- randomLCA(myocardial[, 1:4], freq = myocardial$freq, nclass = 1, cores = 1)</pre>
myocardial.lca2 <- randomLCA(myocardial[, 1:4], freq = myocardial$freq, cores = 1)</pre>
# calculate observed lrt
obslrt <- 2*(logLik(myocardial.lca2)-logLik(myocardial.lca1))</pre>
print(obslrt)
nsims <- 999
# generate the simulations
thesims <- simulate(myocardial.lca1, nsims)</pre>
# for each simulation determin lrt
simlrt <- rep(NA, nsims)</pre>
for (isim in 1:nsims) {
  submodel <- refit(myocardial.lca1, newpatterns = thesims[[isim]])</pre>
  fullmodel <- refit(myocardial.lca2, newpatterns = thesims[[isim]])</pre>
  simlrt[isim] <- 2*(logLik(fullmodel)-logLik(submodel))</pre>
  print(c(isim, simlrt[isim]))
}
# calculate p value as proportion of simulated lrt greater than observed,
# corrected by adding one to numerator and denominator
print((sum(simlrt >= obslrt)+1)/(nsims+1))
```

summary.randomLCA

Summary for randomLCA object

Description

Summarises the fit of a randomLCA object.

Usage

```
## S3 method for class 'randomLCA'
summary(object, ...)
```

Arguments

```
object randomLCA object
... additional argument; currently none is used.
```

symptoms 27

Value

logLik Log Likelihood

AIC AIC BIC BIC

AIC3 AIC with penalty of 3

nclass no of classes
probit link is probit
classp class probabilities

outcome probabilities (conditional)

margoutcomep outcome probabilities (marginal), if model contains random effects

random model includes random effects level2 model has 2 level hierarchy

constload loadings are constant by outcome by class lambda and tau vary by class

lambdacoef lambda coefficients taucoef tau coefficients

Author(s)

Examples

```
pap.lca1 <- randomLCA(pap[, 1:10], freq = pap$Freq, nclass = 1, cores = 1)
summary(pap.lca1)</pre>
```

symptoms	Symptoms data	

Description

This is the data for Beath and Heller (2009).

Allergy and respiratory symptoms for infants 0 to 2 years in six month periods. Outcome is presence or absence of symptom in the six months. Original data was collected at Visits 1-7 over the 2 year period which were summarised to six month periods.

Note that these models can be slow to fit, with the "symptoms.lca2random2" model taking about 1-2 hours.

Thanks to the investigators of the CAPS study for making the data available.

28 symptoms

Usage

symptoms

Format

A data frame with 444 observations on the following 17 variables.

Nightcough. 13 Night cough in visits 1-3

Wheeze . 13 Wheeze in visits 1-3

Itchyrash.13 Itchy rash in visits 1-3

FlexDerma.13 Flexural Dermatitis in visits 1-3

Nightcough. 45 Night cough in visits 1-3

Wheeze . 45 Wheeze in visits 4-5

Itchyrash.45 Itchy rash in visits 4-5

FlexDerma. 45 Flexural Dermatitis in visits 4-5

Nightcough. 6 Night cough in visit 6

Wheeze.6 Wheeze in visit 6

Itchyrash.6 Itchy rash in visit 6

FlexDerma. 6 Flexural Dermatitis in visits 1-3

Nightcough. 7 Night cough in visit 7

Wheeze.7 Wheeze in visit 7

Itchyrash.7 Itchy rash in visit 7

FlexDerma. 7 Flexural Dermatitis in visit 7

Freq Number of subjects

```

uterinecarcinoma

Uterine Carcinoma Data

Description

Classification of 118 histology samples by 118 pathologists. Original classification in Holmquist et al (1967) was to one of five categories, this has been reduced to two. Analysed by a number of authors, with a random effects model in Qu et al (1996).

Usage

uterinecarcinoma

Format

A data frame with 20 observations on the following 8 variables.

- V1 Pathologist 1
- V2 Pathologist 2
- V3 Pathologist 3
- V4 Pathologist 4
- V5 Pathologist 5
- V6 Pathologist 6
- V7 Pathologist 7
