siland-package *Spatial Influence of Landscape*

Description

Method to estimate the spatial influence scales of landscape variables on a response variable. The method is based on Chandler and Hepinstall-Cymerman (2016) Estimating the spatial scales of landscape effects on abundance, *Landscape ecology*, 31: 1383-1394, <doi:10.1007/s10980-016-0380-z>. This package allows for analyzing the effect of landscape features on georeferenced point observations (described in a Geographic Information System shapefile format). It simultaneously estimates the spatial scales and intensities of landscape variable effects. It does not require any information about the scale of effect. Two methods are available: one is based on focal sample site (Bsiland method, b for buffer) and one is distance weighted using Spatial Influence Function (Fsiland method, f for function). It allows for effects tests, effects maps and models comparison.

Details

The DESCRIPTION file:

Package:	siland
Type:	Package
Title:	Spatial Influence of Landscape
Version:	2.0.5
Date:	2021-01-26
Author:	Carpentier F. and Martin O.
Maintainer:	Martin Olivier <olivier.martin@inra.fr>
Description:	Method to estimate the spatial influence scales of landscape variables on a response variable. The method is based on the Bayesian Information criterion (BIC) and the Akaike's An Information Criterion (AIC).
License:	GPL (>=2.0) file LICENSE
Depends:	base, graphics, stats, sf, R (>= 3.5.0)
Imports:	lme4, sp, raster, ggplot2, ggforce, fasterize, reshape2

Author(s)

Carpentier F. and Martin O. Maintainer: Martin Olivier <olivier.martin@inra.fr>

Description

Function calculating the usual Akaike's 'An Information Criterion' for an object of class Bsiland, according to the formula $-2 * \text{loglikelihood} + k * \text{npar}$, with npar the number of parameters of the model and $k = 2$.

Usage

```
## S3 method for class 'Bsiland'
AIC(object, ..., k=2)
```

Arguments

object	an object of class Bsiland
...	Dots are not taken into account in this version
k	not used

Value

AIC value

Bsiland

Estimation of landscape influence using Bsiland method (Buffers)

Description

Function estimating landscape effect (and eventual local effects) using Bsiland method, i.e. estimating simultaneously : the buffer size (radius) and the effect of each landscape variable (and the effect of each local variable).

Usage

```
Bsiland(formula, land, data, family = "gaussian", init = 200, border = F)
```

Arguments

formula	a symbolic description (see lm() or glm()) of the model to be fitted. The details of model specification are given under 'Details'.
land	an object of class sf containing the landscape variables.
data	a dataframe containing the response variable and the local variables.
family	the distribution of response variable. family can be "gaussian", "poisson" or "binomial" and the associated link function are identity, log and logit respectively.
init	a vector indicating the starting values for buffer sizes in the estimation procedure. By default, starting values of buffer sizes of all landscape variable are equal to 200.
border	a logical indicating whether buffers are computed from the observation locations (border=FALSE) or from the border of the polygon where observations are located (border=TRUE))

Details

The Bsiland method is based on the model:

$$E(Y_i) = \mu + \sum_l \alpha_l x_{l,i} + \sum_k \beta_k p_{\delta_k, i}^k$$

with

- Y_i, response variable,

- $x_{l,i}$, local variable l,
- $p_{\delta_k,i}^k$, the percentage of the landscape variable k in a buffer of radius δ_k , centered on site i
- μ , the intercept
- α_l and β_k , the effects of local and landscape variables, respectively.

All parameters, $\mu, \alpha_1, \dots, \alpha_L, \beta_1, \dots, \beta_K$ but also $\delta_1, \dots, \delta_K$ radii of the buffers of the landscape variables are simultaneously estimated by likelihood maximization.

Models for *Bsiland* have the form `response ~ terms` where `response` is the columns name of the response variable in `data` and `terms` is a series of terms which specifies the names of landscape and local explanatory variables. The explanatory variables described in `data` are considered as local in the model, those described in the `sf` object `land` are considered as landscape variables.

For local variables, random effects can be considered using the syntax `(1 | x)` similar to package `lme4` (see `lmer()` function in package `lme4`).

The explanatory variables are added using the symbol `"+"`. Interaction terms can be considered using the usual symbols `"*"` or ":". Notice that only interactions between local x local and local x landscape variables are considered.

Value

`Bsiland` returns an object of type `Bsiland`, a list :

<code>coefficients</code>	a vector of the estimated coefficients
<code>parambuffer</code>	a vector of the estimated buffer radii
<code>formula</code>	an object of class <code>formula</code> that indicates the model
<code>buffer</code>	a data frame indicating the percentages of landscape variables in buffer of estimated sizes centered on observations. The landscape variables are in columns, the observations in rows.
<code>loglik</code>	the estimated maximum loglikelihood
<code>loglik0</code>	the estimated maximum loglikelihood of the local model (no landscape variable)
<code>fitted</code>	the fitted values
<code>resoptim</code>	an object of class <code>optim</code> or <code>optimize</code> giving informations about the optimization procedure see <code>optim()</code> or <code>optimize()</code> for further details.
<code>result</code>	a <code>lm/glm/lmer</code> type object that corresponds to the model estimate knowing the estimated buffer sizes of landscape variables
<code>AIC</code>	the akaike information criterion of the model
<code>AIC0</code>	the akaike information criterion of the local model (no landscape variable)
<code>nparam</code>	the number of parameters
<code>pval0</code>	the p.value of the test of the landscape effect (the global effect of all spatial variables). Issued from the likelihood ratio test of the (complete) model vs the local model (complete model without landscape variables).
<code>family</code>	the family distribution of the model
<code>sd.error</code>	the estimated standard error for gaussian family, NA in other case

model.Type	the type of local model: GLM for generalised model, LMM for linear mixed model or GLMM for generalised linear mixed model
rand.StdDev	the estimated standard deviations of the random effects for LMM or GLMM
err	the estimated residuals
newdata	a dataframe containing the local variables and the percentages of the landscape variables in buffers of estimated buffer sizes for each observation (in rows).
border	a logical indicating the value used for estimation

resB=Bsiland(obs~x1+L1+L2,land=landSiland,data=dataSiland,init = c(50))
resB
summary(resB)
```

Bsiland.lik

-(Loglikelihood) as a function of buffer sizes.

Description

Function investigating eventual optimization problems during numerical optimization of function Bsiland by plotting the -(loglikelihhod) against buffer sizes of each landscape variable.

Usage

```
Bsiland.lik(res, land,data, varnames = NULL, seqd = seq(2, 2000, length = 10))
```

Arguments

<code>res</code>	an object resulting from <code>Bsiland</code>
<code>land</code>	the object of class <code>sf</code> describing the landscape variable, i.e. the <code>land</code> argument in the call to the <code>Bsiland</code> function that computed <code>res</code> .
<code>data</code>	the dataframe describing response variable and the local variables, i.e. the <code>data</code> argument in the call to the <code>Bsiland</code> function that computed <code>res</code> .
<code>varnames</code>	a vector containing the names (characters) of studied landscape variables. If <code>varnames</code> is <code>NULL</code> (by default), all landscape variables of the <code>res</code> model are considered.
<code>seqd</code>	a vector of buffer sizes (positive values) for which the -loglikelihood is computed.

Details

As with all numerical maximisation procedures, optimization problems may arise. The function `Bsiland.lik` allows to point out possible problems of optimization.

`Bsiland.lik` plots the -Loglikelihood against buffers sizes. During the `Bsiland` procedure, the estimation of buffer sizes is made by maximazing the likelihood i.e. by minimizing the -Loglikelihood. The orange horizontal line indicates the minimal value of -Loglikelihood obtained during the estimation (`res` result). The other continous curves represent the -loglikehood as a function of buffer sizes for each studied landscape variable (considering the other parameters of the model at their estimated value in `res`). The dotted lines indicate the values of buffer size estimated (`res` result).

When the minization correctly occurs, the minimal values of the -loglikelihoods for each landscape variable are equal to the value of the estimated minimal -Loglikelihood. This means that the value of each continuous curves is minimal at its intersection with the orange horizontal line. This also means that dotted lines intersect their associated continuous lines at their minimum.

If it is not the case, the minimizing procedure has failed and it is necessary to proceed again with an estimation with different initialisation values. This is possible with the argument `init` in function `Bsiland`.

Value

a ggplot of the -(loglikelihod) against buffer sizes of each landscape variables.

Author(s)

O. Martin and F. Carpentier

Examples

```
data(dataSiland)
data(landSiland)
resB=Bsiland(obs~x1+L1+L2,land=landSiland,data=dataSiland)
Bsiland.lik(resB,dataSiland,land=landSiland,varnames=c("L1","L2"),seqd=seq(5,500,length=20))

# Illustration of failed estimation caused by wrong initial values.
```

```
# In a such case, the estimation should be done again ,
# by calling Bsiland with init=c(250,250) for instance.

resB_fail=Bsiland(obs~x1+L1+L2,land=landSiland,data=dataSiland,init=c(2000,2000))
Bsiland.lik(resB_fail,dataSiland,land=landSiland,varnames=c("L1","L2"),seqd=seq(5,3000,length=20))
```

bufferforsiland *Percentage of landscape variable in buffers.*

Description

Function computing the percentages of landscape variables in buffers of given sizes (i.e. radii).

Usage

```
bufferforsiland(d, sfGIS, loc.sf, landnames, border = F)
```

Arguments

d	a vector of the distances of the buffer sizes. The length of d has to be equal to that of landnames.
sfGIS	an object of class sf containing the landscape variables (land uses). Landscape variables are equal to 1 (presence) or 0 (absence).
loc.sf	an object of class sf or a dataframe containing locations of buffers centers. For dataframe, locations have to be given in columns "X" and "Y".
landnames	a vector of characters of the names of the landscape variables
border	a logical (FALSE by default). If border=FALSE buffers are computed from the locations points given in loc.sf If border=TRUE buffers are computed from the border of the polygon that contain the points in loc.sf.

Value

a dataframe containing the percentages of the landscape variables named landnames (in columns) in buffers of sizes described in d and centered on locations described in loc.sf (in rows).

Author(s)

Martin O.

Examples

```

data(dataSiland)
data(landSiland)
dataSiland[1:10,c("X","Y")]
landSiland$L1
landSiland$L2

bufferforsiland(c(100,200),sfGIS=landSiland, loc.sf=dataSiland, landnames=c("L1","L2"))

```

dataCmoth

Codling moth counts

Description

This data set contains measurements of codling moth counts in 54 orchards. Anonymized data issued from Ricci et al. (2011) study.

Usage

```
data("dataCmoth")
```

Format

A data frame with 54 observations on 4 variables.

[,1]	X	numeric	locations (anonymized)
[,2]	Y	numeric	locations (anonymized)
[,3]	trait	numeric	number of treatments against codling moths in orchards
[,4]	Cmoth	numeric	average count of collected larvae in cardboard traps wrapped around tree trunks.

References

Ricci B., Franck P., Bouvier J.-C., Casado D. and Lavigne C. (2011). Effects of hedgerow characteristics on intra-orchard distribution of larval codling moth. Agriculture, Ecosystems & Environment. 140. 395-400. 10.1016/j.agee.2011.01.001.

dataSiland

Simulated data

Description

Simulated data of response variable and local variables.

Usage

```
data("dataSiland")
```

Format

A data frame with 100 observations on 5 variables.

[,1]	X	numeric	location on X-axis
[,2]	Y	numeric	location on Y-axis
[,3]	x1	numeric	a continuous local variable
[,4]	Id	numeric	identifier
[,5]	obs	numeric	response variable

Examples

```
data(dataSiland)
plot(dataSiland[,c("X", "Y")])
```

fitted.Bsiland

Extract Bsiland model Fitted values

Description

Function extracting fitted values of an object of class Bsiland.

Usage

```
## S3 method for class 'Bsiland'
fitted(object, ...)
```

Arguments

- | | |
|--------|---|
| object | an object of class Bsiland. |
| ... | Dots are not taken into account in this version |

Value

Fitted values extracted from the object object.

Author(s)

O. Martin

fitted.Fsiland	<i>Extract Bsiland model Fitted values</i>
----------------	--

Description

Function extracting fitted values of an object of class Fsiland.

Usage

```
## S3 method for class 'Fsiland'
fitted(object,...)
```

Arguments

object	an object of class Fsiland
...	Dots are not take into account in this version

Value

Fitted values extracted from the object object.

Author(s)

Fsiland	<i>Estimation of landscape influence using Fsiland method (Spatial Influence Function)</i>
---------	--

Description

Function estimating landscape effect (and eventual local effects) using Fsiland method, i.e. estimating simultaneously : the SIF parameter (i.e. mean distance of SIF) and the effect of each landscape variable (and the effect of each local variable).

Usage

```
Fsiland(formula,land,data,family ="gaussian",sif="exponential", init = 100,
border=F,wd=30)
```

Arguments

formula	a symbolic description (see lm() or glm()) of the model to be fitted. The details of model specification are given under 'Details'.
land	an object of class sf containing the landscape variables.
data	a dataframe containing the response variable and the local variables.
family	the distribution of response variable. family can be "gaussian", "poisson" or "binomial" and the associated link function are identity, log and logit respectively.
sif	the family of the Spatial Influence Function. sif can be "exponential", "gaussian" or "uniform".
init	a vector indicating the starting values for SIF parameters in the estimation procedure. By default, starting values of SIF parameters of all landscape variable are equal to 100.
border	a logical indicating whether the spatial influence of the polygon where observations are located is taken into account. If border=FALSE, all pixels of a landscape variable have a spatial influence whether or not they belong to the polygon where the observation is located. If border=TRUE, only pixels outside the polygon of the observation, i.e. from the border of the polygon have an influence on this observation.
wd	a numeric, the size of pixels.

Details

The Fsiland method is based on the model:

$$E(Y_i) = \mu + \sum_l \alpha_l x_{l,i} + \sum_k \beta_k \left(\sum_r f_{\delta_k}(d_{r,i}) z_r^k \right)$$

with

- Y_i, response variable,
- x_l,i, local variable l,
- r, the discretization of study site in pixels r
- z^k_r, the value of the landscape variable k at the pixel r. If the landscape variable k is a presence/absence variable, z^k_r is equal to one or zero.
- μ , the intercept
- α_l and β_k , the effects of local and landscape variables, respectively.
- f_{δ_k} , the SIF associated with the landscape variable k with parameter δ_k (the mean distance of the SIF, see detail further)
- d_r,i the distance between the center of pixel r and the observation at site i.

All parameters, μ , $\alpha_1, \dots, \alpha_L$, β_1, \dots, β_K but also $\delta_1, \dots, \delta_K$ SIF parameters of the landscape variables are simultaneously estimated by likelihood maximization.

Models for *Fsiland* have the form `response ~ terms` where `response` is the columns name of the response variable in `data` and `terms` is a series of terms which specifies the names of landscape and

local explanatory variables. The explanatory variables described in `data` are considered as local in the model, those described in the `sf` object `land` are considered as landscape variables.

For local variables, random effects can be considered using the syntax `(1|x)` similar to package `lme4` (see `lmer()` function in package `lme4`). Interaction terms are not yet implemented in `Fsiland` contrary to `Bsiland`.

The explanatory variables are added using the symbol `"+"`. Interaction terms can be considered using the usual symbols `"*"` or ":". Notice that only interactions between local x local and local x landscape variables are considered.

Two families of SIF are currently implemented in the `siland` package, exponential and Gaussian families defined as $f_\delta(d) = 2/(\pi\delta^2)\exp(-2d/\delta)$ and $f_\delta(d) = 1/(2\delta\sqrt{\pi})\exp(-d\pi/(2\delta))^2$, respectively. By definition, δ represents the mean distance of these SIF.

The computation of the spatial influence of landscape variables is based on an approximation through the description of landscape variables distribution along a regular grid (modelisation of spatial influence of each pixel of landscape variable). The choice of `wd`, the size of pixels can have an impact on the estimation. The smaller the pixels, the more accurate the approximation, but also the longer the computation time. In our experience, we recommend using a pixel size at most three times smaller than the smallest estimated mean distance among the landscape variables SIF.

Value

`Fsiland` returns an object of type `Fsiland`, a list :

<code>coefficients</code>	a vector of the estimated coefficients
<code>paramSIF</code>	a vector of the estimated parameters of SIF
<code>formula</code>	an object of class <code>formula</code> that indicates the model
<code>landcontri</code>	a datafram of estimated cumulative influence of each landscape variable (in columns) on each observation (in rows).
<code>loglik</code>	the estimated maximum loglikelihood
<code>loglik0</code>	the estimated maximum loglikelihood of the local model (no landscape variable)
<code>result</code>	a <code>lm/glm/lmer</code> object that corresponds to the model estimate knowing the estimated SIF parameters of landscape variables.
<code>fitted</code>	the fitted values
<code>sif</code>	the family of the SIF
<code>resoptim</code>	an object of class <code>optim</code> or <code>optimize</code> giving informations about the optimization procedure see <code>optim()</code> or <code>optimize()</code> for further details.
<code>AIC</code>	the akaike information criterion of the model
<code>AIC0</code>	the akaike information criterion of the local model (no landscape variable)
<code>nparam</code>	the number of parameters
<code>pval0</code>	the p.value of the test of the landscape effect (the global effect of all spatial variables). Issued from the likelihood ratio test of the (complete) model vs the local model (complete model without landscape variables).
<code>family</code>	the family distribution for the model
<code>sd.error</code>	the estimated standard error for gaussian family, NA in other case

model.Type	the type of local model: GLM for generalised model, LMM for linear mixed model or GLMM for generalised linear mixed model
rand.StdDev	the estimated standard deviation of random effects for LMM or GLMM
err	the estimated residuals
border	a logical indicating the value used for estimation
wd	a number indicating the size of pixels

Author(s)

Carpentier, F. and Martin, O.

resF
resF$AIC
```

Fsiland.lik

-(Loglikelihood) as a function of SIF parameters.

Description

Function investigating eventual optimization problems during numerical optimization of function Fsiland by plotting the -(loglikelihod) against parameters of Spatial Influence Functions (SIF) of each landscape variable. The parameter of a SIF is defined as the mean distance of SIF.

Usage

```
Fsiland.lik(res, land,data, varnames = NULL, seqd = seq(2, 2000, length = 10))
```

Arguments

res	an object resulting from Fsiland
land	the object of class sf describing the landscape variable, i.e. the land" argument in the call to the Fsiland function that computed res.
data	the dataframe describing response variable and the local variables, i.e. the data argument in the call to the Fsiland function that computed res.

varnames	a vector containing the names (characters) of studied landscape variables. If varnames is NULL (by default), all landscape variables of the res model are considered.
seqd	a vector of SIF parameters (positive values) for which the -loglikelihood is computed.

Details

As with all numerical maximisation procedures, optimization problems may arise. The function *Fsiland.lik* allows to point out possible problems of optimization.

Fsiland.lik plots the -Loglikelihood against SIF parameters. During the *Fsiland* procedure, the estimation of SIF parameters is made by maximizing the likelihood i.e. by minimizing the -Loglikelihood. The orange horizontal line indicates the minimal value of -Loglikelihood obtained during the estimation (res result). The other continuous curves represent the -loglikelihood as a function of SIF parameters for each studied landscape variable (considering the other parameters of the model at their estimated value in res). The dotted lines indicate the values of SIF parameter estimated (res result).

When the minimization correctly occurs, the minimal values of the -loglikelihoods for each landscape variable are equal to the value of the estimated minimal -Loglikelihood. This means that the value of each continuous curves is minimal at its intersection with the orange horizontal line. This also means that dotted lines intersect their associated continuous lines at their minimum.

If it is not the case, the minimizing procedure has failed and it is necessary to proceed again with an estimation with different initialisation values. This is possible with the argument *init* in function *Fsiland*.

Value

a ggplot of the -(loglikelihod) against SIF parameters of each landscape variables.

Author(s)

O. Martin and F. Carpentier

Examples

```

data(dataSiland)
data(landSiland)
resF=Fsiland(obs~x1+L1+L2,data=dataSiland,land=landSiland)
Fsiland.lik(resF,dataSiland,land=landSiland,varnames=c("L1","L2"),seqd=seq(5,500,length=20))

# Illustration of failed estimation caused by wrong initial
# values (chosen initial values that are deliberately and obviously far too high)
# In a such case, the estimation should be done again ,
# by calling Fsiland with init=c(250,250) for instance.

resF2=Fsiland(obs~x1+L1+L2,data=dataSiland,land=landSiland,init=c(20000,20000))
Fsiland.lik(resF2,dataSiland,land=landSiland,varnames=c("L1","L2"),seqd=seq(1e9,1e10,length=20))

```

Fsiland.quantile *Quantile of spatial influence function (SIF)*

Description

function computing quantiles of SIF, i.e. the radius of disk on which the integrated influence of the SIF is equal to given proportions, p. Calculations are performed for the estimated SIF of each landscape variable in x. The **area of medium influence and significant influence of a landscape variable**, that we defined as the disc containing 50% and 95% of the influence of the SIF (neglecting 50% and 5% of its broader effect) respectively can be computed using argument `p = 0.5` and `p = 0.95`, respectively.

Usage

```
Fsiland.quantile(x, p = 0.95)
```

Arguments

- | | |
|---|--|
| x | an object of class Fsiland resulting from function Fsiland |
| p | a vector of probabilities |

Value

A matrix of the radii of disks on which the integrated influences of the SIF estimated for each landscape variable of x (in columns) are equal to each probability of the vector p (in rows).

Author(s)

O. Martin and F. Carpentier

Examples

```
data(dataSiland)
data(landSiland)
resF=Fsiland(obs~x1+L1+L2,land=landSiland,data=dataSiland,sif="exponential")
Fsiland.quantile(x=resF,p=c(0.5,0.95))
```

landCmoth*Landscape of dataCmoth observations***Description**

This data set contains description of landscape associated to dataCmoth data. 3 Landscape variables are considered conventional orchards, organic orchards and vignards. Anonymized data issued from Ricci et al. (2011) study.

landCmoth is a sf object and gives the positions for three landscape variables: conv, org and vine.

Usage

```
data("landCmoth")
```

Format

A sf object with 11157 observations of 4 variables :

[,1]	conv	numeric	presence/absence of conventional orchard (0/1)
[,2]	org	numeric	presence/absence of organic orchard (0/1)
[,3]	vine	numeric	presence/absence of vignards (0/1)
[,4]	geometry	sfc_MULTIPOLYGON	location of polygons (anonymized)

References

Ricci B., Franck P., Bouvier J.-C., Casado D. and Lavigne C. (2011). Effects of hedgerow characteristics on intra-orchard distribution of larval codling moth. Agriculture, Ecosystems & Environment. 140. 395-400. 10.1016/j.agee.2011.01.001.

landSiland*Simulated landscape.***Description**

Simulated landscape associated to dataSiland, containing two landscape variables, named L1 and L2.

Usage

```
data("landSiland")
```

Format

A sf object with 4884 observations on 3 variables.

[,1]	L1	numeric	presence/absence of L1 (0/1)
[,2]	L2	numeric	presence/absence of L2 (0/1)
[,3]	geometry	sfc_MULTIPOLYGON	polygon location

Examples

```
data(landSiland)
plot(landSiland$geometry)
plot(landSiland[landSiland$L1==1,]$geometry,col=2,add=TRUE)
plot(landSiland[landSiland$L2==1,]$geometry,col=3,add=TRUE)
```

landtoraster

Transformation of an sf object into raster

Description

Function transforming an object of class sf into raster (points grid) with wd, the pixel size of the raster. landname gives the variable names for which raster points have to be computed.

Usage

```
landtoraster(landgis, landname, wd, data = NULL)
```

Arguments

landgis	an object of class sf
landname	vector of names of landscape variable for which rasters are computed.
wd	numeric, pixels size of raster
data	a dataframe with X and Y columns, locations.

Value

a list of dataframes. The components of the list correspond to variables specified in argument landname. Each dataframe gives the X and Y locations of pixels in raster.

Author(s)

O. Martin

Examples

```
##---- Should be DIRECTLY executable !! ----
##-- ==> Define data, use random,
##--or do help(data=index) for the standard data sets.

data(dataSiland)
data(landSiland)
head(dataSiland)
head(landSiland)
u1=landtoraster(landSiland,c("L1","L2"),wd=20)
names(u1)
plot(u1[[1]][,c("X","Y")],pch=".")
u2=landtoraster(landSiland,c("L1","L2"),wd=20,data=dataSiland)
points(u2[[1]][,c("X","Y")],pch=". ",col=2)
points(dataSiland[,c("X","Y")],pch=16,cex=0.6,col=3)
```

likresB1

Result for vignette of siland

Description

Precomputed result for vignette of siland

plot.Bsiland

Plot an object of class Bsiland

Description

This function calls the function plot.lm() and plot the object result stored in x

Usage

```
## S3 method for class 'Bsiland'
plot(x, ...)
```

Arguments

- | | |
|-----|--|
| x | an object of class Bsiland |
| ... | the same options as for the function plot.lm() |

`plot.Fsiland` *Plot an object of class Fsiland*

Description

This function calls the function `plot.lm()` and plot the object result stored in `x`

Usage

```
## S3 method for class 'Fsiland'
plot(x, ...)
```

Arguments

<code>x</code>	an object of class <code>Fsiland</code>
...	the same options as for the function <code>plot.lm()</code>

`plotBsiland.land` *Map of Bsiland result*

Description

Function creating a map of Bsiland result, i.e. buffers estimations for each landscape variable.

Usage

```
plotBsiland.land(x, land, data, var = 1, landviz=T )
```

Arguments

<code>x</code>	an object resulting from <code>Bsiland</code>
<code>land</code>	the object of class <code>sf</code> describing the landscape variable, i.e. the <code>land</code> argument in the call to the <code>Bsiland</code> function that computed <code>x</code>
<code>data</code>	the dataframe describing response variable and the local variables, i.e. the <code>data</code> argument in the call to the <code>Bsiland</code> function that computed <code>x</code> .
<code>var</code>	a vector containing the numbers (numeric) of the mapped landscape variables.
<code>landviz</code>	If <code>landviz=T</code> (by default), polygons where the variable <code>var</code> is observed are colored in gray.

Value

a ggplot of class of the landscape effect estimated in the `Bsiland` object `x` i.e. a map of buffers.

See Also

Bsiland

Examples

```
data(dataSiland)
data(landSiland)
resB=Bsiland(obs~x1+L1+L2,land=landSiland,data=dataSiland)
plotBsiland.land(x=resB,land=landSiland,data=dataSiland)
plotBsiland.land(x=resB,land=landSiland,data=dataSiland,var=2)
```

plotFsiland*Plot results from Fsiland function***Description**

Plot locations of observed data and locations of landscape variables. The black points correspond to the locations of observed data, and the size is proportional to numeric values. The locations of different landscape variables are displayed with small points of different colours. Estimated mean distance of spatial influence for each landscape variable is indicated beside the graphic with a continuous line. Dashed line indicates the radius that gives 95 percent of the total influence of each landscape variable.

Usage

```
plotFsiland(res, land, data)
```

Arguments

- | | |
|-------------|--|
| res | an object obtained from the function Fsiland |
| land | an object of class sf that gives the landscape variables |
| data | a dataframe with the response variable and the local variables |

Value

an object of class ggplot

Examples

```
data(dataSiland)
data(landSiland)
resF=Fsiland(obs~x1+L1+L2,land=landSiland,data=dataSiland,sif="exponential")
plotFsiland(resF,landSiland, dataSiland)
```

`plotFsiland.land` *Map of Fsiland result*

Description

Function creating a map of Fsiland result, i.e. estimatied spatial influence of each landscape variable or for the cumulative effect of all variables.

Usage

```
plotFsiland.land(x, land, data, var = 0, lw = 100, xlim=NULL, ylim=NULL, plot=T)
```

Arguments

<code>x</code>	an object resulting from <code>Fsiland</code>
<code>land</code>	the object of class <code>sf</code> describing the landscape variable, i.e. the <code>land</code> argument in the call to the <code>Fsiland</code> function that computed <code>x</code>
<code>data</code>	the dataframe describing response variable and the local variables, i.e. the <code>data</code> argument in the call to the <code>Fsiland</code> function that computed <code>x</code> .
<code>var</code>	a vector containing the numbers (numeric) of the mapped landscape variables. If <code>var=0</code> (by default), the cumulative effect of all landscape variables is represented.
<code>lw</code>	the number of pixels on x-axis and y-axis for the graphical representation. A too high value can lead to memory allocation problems. By default <code>lw=100</code> .
<code>xlim</code>	a length-2 numeric vector, lower and upper limits of x-axis.
<code>ylim</code>	a length-2 numeric vector, lower and upper limits of y-axis.
<code>plot</code>	a logical (TRUE by default). If TRUE, the result is a graphic. If FALSE, the result is a dataframe of the cumulative spatial influence of the landscape variable(s) <code>var</code> .

Value

an object of class `ggplot`

See Also

`Fsiland`

Examples

```
data(dataSiland)
data(landSiland)
resF=Fsiland(obs~x1+L1+L2,land=landSiland,data=dataSiland,sif="exponential")
plotFsiland.land(x=resF,land=landSiland,data=dataSiland)
plotFsiland.land(x=resF,land=landSiland,data=dataSiland,var=1,lw=20)
```

```
plotFsiland.land(x=resF,land=landSiland,data=dataSiland,var=2,lw=20)
```

plotFsiland.sif *Plot the estimated spatial influence functions.*

Description

Graphic representations for the different influence functions estimated with the function Fsiland().

Usage

```
plotFsiland.sif(x)
```

Arguments

x an object obtained with function Fsiland().

Value

no value is returned

See Also

Fsiland

Examples

```
data(dataSiland)
data(landSiland)
resF=Fsiland(obs~x1+L1+L2,land=landSiland,data=dataSiland,sif="exponential")
plotFsiland.sif(x=resF)
```

print.Bsiland	<i>Bsiland print</i>
---------------	----------------------

Description

function printing an object of class Bsiland. It returns the model used and the estimated parameters.

Usage

```
## S3 method for class 'Bsiland'  
print(x,...)
```

Arguments

- | | |
|-----|---------------------------------------|
| x | an object of class Bsiland. |
| ... | not take into account in this version |

print.Fsiland	<i>Fsiland print</i>
---------------	----------------------

Description

function printing an object of class Bsiland. It returns the model used and the estimated parameters.

Usage

```
## S3 method for class 'Fsiland'  
print(x,...)
```

Arguments

- | | |
|-----|---------------------------------------|
| x | an object of class Fsiland |
| ... | not take into account in this version |

resB1	<i>Result for vignette of siland</i>
-------	--------------------------------------

Description

Precomputed result for vignette of siland

resB2 *Result for vignette of siland*

Description

Precomputed result for vignette of siland

resB3 *Result for vignette of siland*

Description

Precomputed result for vignette of siland

resF1 *Result for vignette of siland*

Description

Precomputed result for vignette of siland

resF3 *Result for vignette of siland*

Description

Precomputed result for vignette of siland

resF4 *Result for vignette of siland*

Description

Precomputed result for vignette of siland

resF5.1

Result for vignette of siland

Description

Precomputed result for vignette of siland

resF5.2

Result for vignette of siland

Description

Precomputed result for vignette of siland

residuals.Bsiland

Extract Bsiland Residuals

Description

Function extracting residuals for an estimated Bsiland model.

Usage

```
## S3 method for class 'Bsiland'  
residuals(object, ...)
```

Arguments

object	an object of class Bsiland
...	Dots are not take into account in this version

residuals.Fsiland *Extract Fsiland Residuals*

Description

Function extracting residuals for an estimated Bsiland model.

Usage

```
## S3 method for class 'Fsiland'
residuals(object, ...)
```

Arguments

object	an object of class Fsiland
...	Dots are not take into account in this version

resY *Result for vignette of siland*

Description

Precomputed result for vignette of siland

summary.Bsiland *The function gives a summary of an object of class Bsiland*

Description

The function gives a detailed summary of an object of class Fsiland. It gives results as the summary for an object of type glm or lm.

Usage

```
## S3 method for class 'Bsiland'
summary(object, ...)
```

Arguments

object	an object of type Bsiland
...	Dots are not take into account in this version

summary.Fsiland *The function gives a summary of an object of class Fsiland*

Description

The function gives a detailed summary of an object of class Fsiland. It gives results as the summary for an object of type glm or lm.

Usage

```
## S3 method for class 'Fsiland'  
summary(object, ...)
```

Arguments

object	an object of type Fsiland
...	Dots are not take into account in this version
