Package 'tidydice'

April 19, 2021

Type Package

Title Simulates Dice Rolls and Coin Flips

Version 0.1.1

Author Roland Krasser

Maintainer Roland Krasser <roland.krasser@gmail.com>

Description Utils for basic statistical experiments, that can be used for teaching introductory statistics. Each experiment generates a tibble.
Dice rolls and coin flips are simulated using sample().
The properties of the dice can be changed, like the number of sides.
A coin flip is simulated using a two sided dice.
Experiments can be combined with the pipe-operator.

R topics documented:

`binom` *Binomial distribution as table.*

Description

Generates a tibble containing the binomial distribution using dbinom().

Usage

```
binom(times, prob_success)
```

Arguments

`times`	number of trials
`prob_success`	probability of success (number between 0 and 1)

Value

Binomial distribution as a tibble

Examples

```
binom(times = 10, prob_success = 1/10)
```

`binom_coin` *Binomial distribution of flipping a coin.*

Description

Generates a tibble containing the binomial distribution of flipping a coin using dbinom().

Usage

```
binom_coin(times, sides = 2, success = 2)
```

Arguments

times	how many times a coin is flipped (or how many coins are flipped at the same time)
sides	number of sides of the coin (default = 2)
success	which result is a success (default = 2)

Value

binomial distribution as a tibble

Examples

```
binom_coin(times = 10)
```

---

binom_dice *Binomial distribution of rolling a dice.*

Description

Generates a tibble containing the binomial distribution of rolling the dice using dbinom().

Usage

```
binom_dice(times, sides = 6, success = 6)
```

Arguments

times	How many times a dice is rolled (or how many dice are rolled at the same time)
sides	Number of sides of the dice (default = 6)
success	Which result is a success (default = 6)

Value

Binomial distribution as a tibble

Examples

```
binom_dice(times = 10)
```

circle_points *Helper function to draw a circle*

Description

Helper function to draw a circle

Usage

```
circle_points(center = c(0, 0), diameter = 1, npoints = 61)
```

Arguments

center	Vector with x and y coordinate of center
diameter	Diameter of circle
npoints	Number of points used for drawing a circle

Value

Dataframe with x and y coordinates to draw a circle

flip_coin *Simulating flipping a coin.*

Description

Flipping a coin is simulated using sample(). The default coin has 2 sides and is fair. The properties of the coin can be changed. The result is returned as a tibble.

Usage

```
flip_coin(
  data = NULL,
  times = 1,
  rounds = 1,
  success = c(2),
  agg = FALSE,
  sides = 2,
  prob = NULL,
  seed = NULL
)
```

Arguments

data	Data from a previous experiment
times	How many times coin is flipped (or how many coins are flipped at the same time)
rounds	Number of rounds
success	Which result is a success (default = 2)
agg	If TRUE, the result is aggregated (by experiment, rounds)
sides	Number of sides of the coin (default = 2)
prob	Vector of probabilities for each side of the coin
seed	Seed to produce reproducible results

Value

Result of experiment as a tibble

Examples

```
# flipping a coin
flip_coin()

# flipping a coin 10 times
flip_coin(times = 10)

# aggregate result
flip_coin(times = 10, agg = TRUE)

# rounds
flip_coin(times = 10, rounds = 3, agg = TRUE)

# experiments
library(dplyr)
flip_coin(times = 10, rounds = 3, agg = TRUE) %>%
  flip_coin(times = 12, rounds = 3, agg = TRUE)
```

---

force_coin *Force a coin flipping result.*

Description

The forced result is returned as a tibble.

Usage

```
force_coin(data = NULL, result = 6, round = 1, experiment = 1, success = 2)
```

Arguments

data	Data from a previous experiment
result	Vector of flipping coin results
round	Round of flipping coin
experiment	Experiment Number
success	Which result is a success (default = 6)

Value

Result of experiment as a tibble

Examples

```
force_coin(6)
force_coin(1:6)
```

---

force_dice *Force a dice rolling result.*

Description

The forced result is returned as a tibble.

Usage

```
force_dice(data = NULL, result = 6, round = 1, experiment = 1, success = 6)
```

Arguments

data	Data from a previous experiment
result	Vector of rolling dice results
round	Round of rolling dice
experiment	Experiment Number
success	Which result is a success (default = 6)

Value

Result of experiment as a tibble

Examples

```
force_dice(6)
force_dice(1:6)
```

plot_binom *Plot a binomial distribution.*

Description

Plot a binomial distribution generated with dice_binom() or coin_binom()

Usage

```
plot_binom(
  data,
  title = "Binomial distribution",
  color = "darkgrey",
  color_highlight = "red",
  label = NULL,
  label_size = 3,
  min_pct = 0.05,
  highlight = NULL
)
```

Arguments

data	data containing values for binomial distribution
title	title of the plot
color	color of bars
color_highlight	color of highlighted bars
label	add labels to plot?
label_size	size of label
min_pct	surpress values < min_pct
highlight	vector of values to be highlighted

Value

ggplot object

Examples

```
plot_binom(data = binom_dice(times = 10))
```

plot_dice *Plot result of roll_dice()*

Description

Plot result of roll_dice()

Usage

```
plot_dice(
  data,
  detailed = FALSE,
  fill = "white",
  fill_success = fill,
  point_color = "black",
  line_color = "black",
  line_size = 0.8
)
```

Arguments

data	result of roll_dice()
detailed	If TRUE, the dice is plotted with more details
fill	Fill color
fill_success	Fill color if result is a success
point_color	Color of Points
line_color	Color of Lines
line_size	Size of Lines

Value

ggplot-Object

Examples

```
library(magrittr)
plot_dice()
roll_dice(times = 3, rounds = 3) %>% plot_dice()
roll_dice(times = 3, rounds = 3) %>% plot_dice(fill_success = "red")
```

plot_single_dice *Draw a single dice*

Description

Draw a single dice

Usage

```
plot_single_dice(
  ggplot = NULL,
  result = 6,
  x = 0,
  y = 0,
  width = 0.9,
  fill = "white",
  detailed = FALSE,
  rounding = dice_width/5,
  line_size = 0.8,
  line_color = "black",
  point_size = width/6,
  point_color = "black"
)
```

Arguments

ggplot	ggplot-Object. If passed, the dice will be added to plot
result	Result of dice rolling (0..6)
x	X-coordinate of dice (center)
y	y-coordinate of dice (center)
width	Width of dice
fill	Fill color
detailed	If TRUE, the dice is plotted with more details
rounding	Rounding of dice (only used if detailed == TRUE)
line_size	Size of Lines
line_color	Color of Lines
point_size	Size of Points
point_color	Color of Points

Value

ggplot-Object

`roll_dice` *Simulating rolling a dice.*

Description

Rolling a dice is simulated using sample(). The default dice has 6 sides and is fair. The properties of the dice can be changed. The result is returned as a tibble.

Usage

```
roll_dice(
  data = NULL,
  times = 1,
  rounds = 1,
  success = c(6),
  agg = FALSE,
  sides = 6,
  prob = NULL,
  seed = NULL
)
```

Arguments

`data`	Data from a previous experiment
`times`	How many times a dice is rolled (or how many dice are rolled at the same time)
`rounds`	Number of rounds
`success`	Which result is a success (default = 6)
`agg`	If TRUE, the result is aggregated (by experiment, rounds)
`sides`	Number of sides of the dice (default = 6)
`prob`	Vector of probabilities for each side of the dice
`seed`	Seed to produce reproducible results

Value

Result of experiment as a tibble

Examples

```
# rolling a dice once
roll_dice()

# rolling a dice 10 times
roll_dice(times = 10)

# aggregate result
roll_dice(times = 10, agg = TRUE)
```

```
# rounds
roll_dice(times = 10, rounds = 3, agg = TRUE)

# experiments
library(dplyr)
roll_dice(times = 10, rounds = 3, agg = TRUE) %>%
  roll_dice(times = 12, rounds = 3, agg = TRUE)
```
