Package 'tidytransit'

May 20, 2022

Type Package

Title Read, Validate, Analyze, and Map GTFS Feeds

Version 1.3.1

Description Read General Transit Feed Specification (GTFS) zipfiles into a list of R dataframes. Perform validation of the data structure against the specification. Analyze the headways and frequencies at routes and stops. Create maps and perform spatial analysis on the routes and stops. Please see the GTFS documentation here for more detail: <https://gtfs.org/>.

License GPL

LazyData TRUE

Depends R (>= 3.6.0)

Imports gtfsio (>= 0.1.0), dplyr, data.table (>= 1.12.8), httr, rlang, sf, hms, digest, checkmate, geodist

Suggests testthat, knitr, markdown, rmarkdown, ggplot2, scales, lubridate

RoxygenNote 7.1.2

R topics documented:

`cluster_stops` *Cluster nearby stops within a group*

Description

Finds clusters of stops for each unique value in `group_col` (e.g. stop_name). Can be used to find different groups of stops that share the same name but are located more than `max_dist` apart. `gtfs_stops` is assigned a new column (named `cluster_colname`) which contains the `group_col` value and the cluster number.

Usage

```
cluster_stops(
  gtfs_stops,
  max_dist = 300,
  group_col = "stop_name",
  cluster_colname = "stop_name_cluster"
)
```

Arguments

`gtfs_stops`	Stops table of a gtfs object. It is also possible to pass a tidygtfs object to enable piping.
`max_dist`	Only stop groups that have a maximum distance among them above this threshold (in meters) are clustered.
`group_col`	Clusters for are calculated for each set of stops with the same value in this column (default: stop_name)
`cluster_colname`	Name of the new column name. Can be the same as group_col to overwrite.

Details

`stats::kmeans()` is used for clustering.

Value

Returns a stops table with an added cluster column. If `gtfs_stops` is a tidygtfs object, a modified tidygtfs object is return

Examples

```
library(dplyr)
nyc_path <- system.file("extdata", "google_transit_nyc_subway.zip", package = "tidytransit")
nyc <- read_gtfs(nyc_path)
nyc <- cluster_stops(nyc)

# There are 6 stops with the name "86 St" that are far apart
stops_86_St = nyc$stops %>%
  filter(stop_name == "86 St")

table(stops_86_St$stop_name_cluster)
#> 86 St [1] 86 St [2] 86 St [3] 86 St [4] 86 St [5] 86 St [6]
#>         3         3         3         3         3         3

stops_86_St %>% select(stop_id, stop_name, parent_station, stop_name_cluster) %>% head()
#> # A tibble: 6 × 4
#>   stop_id stop_name parent_station stop_name_cluster
#>   <chr>   <chr>     <chr>          <chr>
#> 1 121     86 St     ""             86 St [3]
#> 2 121N    86 St     "121"          86 St [3]
#> 3 121S    86 St     "121"          86 St [3]
#> 4 626     86 St     ""             86 St [4]
#> 5 626N    86 St     "626"          86 St [4]
#> 6 626S    86 St     "626"          86 St [4]

library(ggplot2)
ggplot(stops_86_St) +
  geom_point(aes(stop_lon, stop_lat, color = stop_name_cluster))
```

`convert_times_to_hms` *Use hms::hms columns in feed*

Description

Overwirtes character columns in stop_times (arrival_time, departure_time) and frequencies (start_time, end_time) with times converted with `hms::hms()`.

Usage

```
convert_times_to_hms(gtfs_obj)
```

Arguments

`gtfs_obj`	a gtfs object in which hms times should be set, the modified gtfs_obj is returned

Value

gtfs_obj with added hms times columns for stop_times and frequencies

empty_strings_to_na *Convert empty strings ("") to NA values in gtfs tables*

Description

Convert empty strings ("") to NA values in gtfs tables

Usage

```
empty_strings_to_na(gtfs_obj)
```

Arguments

gtfs_obj	tidygtfs object

Value

a gtfs_obj where all empty strings in tables have been replaced with NA

feedlist *Dataframe of source GTFS data from Transitfeeds*

Description

A dataset containing a list of URLs for GTFS feeds

Usage

```
feedlist
```

Format

A data frame with 911 rows and 10 variables:

id the id of the feed on transitfeeds.com

t title of the feed

loc_id location id

loc_pid location placeid of the feed on transitfeeds.com

loc_t the title of the location

loc_n the shortname fo the location

loc_lat the location latitude

loc_lng the location longitude

url_d GTFS feed url

url_i the metadata url for the feed

Source

https://transitfeeds.com/

`feed_contains` *Returns TRUE if the given gtfs_obj contains the table. Used to check for tidytransit's calculated tables in sublist*

Description

Returns TRUE if the given gtfs_obj contains the table. Used to check for tidytransit's calculated tables in sublist

Usage

```
feed_contains(gtfs_obj, table_name)
```

Arguments

`gtfs_obj`	gtfs object
`table_name`	name as string of the table to look for

`filter_feed_by_area` *Filter a gtfs feed so that it only contains trips that pass a given area*

Description

Only stop_times, stops, routes, services (in calendar and calendar_dates), shapes, frequencies and transfers belonging to one of those trips are kept.

Usage

```
filter_feed_by_area(gtfs_obj, area)
```

Arguments

`gtfs_obj`	tidygtfs object
`area`	all trips passing through this area are kept. Either a bounding box (numeric vector with xmin, ymin, xmax, ymax) or a sf object.

Value

tidygtfs object with filtered tables

See Also

`filter_feed_by_stops`, `filter_feed_by_trips`, `filter_feed_by_date`

filter_feed_by_date *Filter a gtfs feed so that it only contains trips running on a given date*

Description

Only stop_times, stops, routes, services (in calendar and calendar_dates), shapes, frequencies and transfers belonging to one of those trips are kept.

Usage

```
filter_feed_by_date(
  gtfs_obj,
  extract_date,
  min_departure_time,
  max_arrival_time
)
```

Arguments

gtfs_obj	a gtfs feed
extract_date	date to extract trips from this day (Date or "YYYY-MM-DD" string)
min_departure_time	(optional) The earliest departure time. Can be given as "HH:MM:SS", hms object or numeric value in seconds.
max_arrival_time	(optional) The latest arrival time. Can be given as "HH:MM:SS", hms object or numeric value in seconds.

Value

tidygtfs object with filtered tables

See Also

filter_stop_times, filter_feed_by_trips, filter_feed_by_trips, filter_feed_by_date

filter_feed_by_stops *Filter a gtfs feed so that it only contains trips that pass the given stops*

Description

Only stop_times, stops, routes, services (in calendar and calendar_dates), shapes, frequencies and transfers belonging to one of those trips are kept.

Usage

```
filter_feed_by_stops(gtfs_obj, stop_ids = NULL, stop_names = NULL)
```

Arguments

gtfs_obj	tidygtfs object
stop_ids	vector with stop_ids. You can either provide stop_ids or stop_names
stop_names	vector with stop_names (will be converted to stop_ids)

Value

tidygtfs object with filtered tables

Note

The returned gtfs_obj likely contains more than just the stops given (i.e. all stops that belong to a trip passing the initial stop).

See Also

filter_feed_by_trips, filter_feed_by_trips, filter_feed_by_date

---

filter_feed_by_trips *Filter a gtfs feed so that it only contains a given set of trips*

Description

Only stop_times, stops, routes, services (in calendar and calendar_dates), shapes, frequencies and transfers belonging to one of those trips are kept.

Usage

```
filter_feed_by_trips(gtfs_obj, trip_ids)
```

Arguments

gtfs_obj	tidygtfs object
trip_ids	vector with trip_ids

Value

tidygtfs object with filtered tables

See Also

filter_feed_by_stops, filter_feed_by_area, filter_feed_by_date

filter_stops *Get a set of stops for a given set of service ids and route ids*

Description

Get a set of stops for a given set of service ids and route ids

Usage

```
filter_stops(gtfs_obj, service_ids, route_ids)
```

Arguments

gtfs_obj	as read by read_gtfs()
service_ids	the service for which to get stops
route_ids	the route_ids for which to get stops

Value

stops table for a given service

Examples

```
library(dplyr)
local_gtfs_path <- system.file("extdata", "google_transit_nyc_subway.zip", package = "tidytransit")
nyc <- read_gtfs(local_gtfs_path)
select_service_id <- filter(nyc$calendar, monday==1) %>% pull(service_id)
select_route_id <- sample_n(nyc$routes, 1) %>% pull(route_id)
filtered_stops_df <- filter_stops(nyc, select_service_id, select_route_id)
```

filter_stop_times *Filter a* stop_times *table for a given date and timespan.*

Description

Filter a stop_times table for a given date and timespan.

Usage

```
filter_stop_times(gtfs_obj, extract_date, min_departure_time, max_arrival_time)
```

Arguments

gtfs_obj	a gtfs feed
extract_date	date to extract trips from this day (Date or "YYYY-MM-DD" string)
min_departure_time	(optional) The earliest departure time. Can be given as "HH:MM:SS", hms object or numeric value in seconds.
max_arrival_time	(optional) The latest arrival time. Can be given as "HH:MM:SS", hms object or numeric value in seconds.

Value

Filtered stop_times data.table for travel_times() and raptor().

Examples

```
feed_path <- system.file("extdata", "sample-feed-fixed.zip", package = "tidytransit")
g <- read_gtfs(feed_path)

# filter the sample feed
stop_times <- filter_stop_times(g, "2007-01-06", "06:00:00", "08:00:00")
```

---

get_feedlist *Get list of all available feeds from transitfeeds API*

Description

Get list of all available feeds from transitfeeds API

Usage

```
get_feedlist()
```

Value

a data frame with the gtfs feeds on transitfeeds

See Also

feedlist_df

Examples

```
## Not run:
feedlist_df <- get_feedlist()

## End(Not run)
```

get_route_frequency *Get Route Frequency*

Description

Calculate the number of departures and mean headways for routes within a given timespan and for given service_ids.

Usage

```
get_route_frequency(
  gtfs_obj,
  start_time = "06:00:00",
  end_time = "22:00:00",
  service_ids = NULL
)
```

Arguments

gtfs_obj	a list of gtfs dataframes as read by the trread package.
start_time	analysis start time, can be given as "HH:MM:SS", hms object or numeric value in seconds.
end_time	analysis perdiod end time, can be given as "HH:MM:SS", hms object or numeric value in seconds.
service_ids	A set of service_ids from the calendar dataframe identifying a particular service id. If not provided, the service_id with the most departures is used.

Value

a dataframe of routes with variables or headway/frequency in seconds for a route within a given time frame

Note

Some GTFS feeds contain a frequency data frame already. Consider using this instead, as it will be more accurate than what tidytransit calculates.

Examples

```
data(gtfs_duke)
routes_frequency <- get_route_frequency(gtfs_duke)
x <- order(routes_frequency$median_headways)
head(routes_frequency[x,])
```

get_route_geometry *Get all trip shapes for a given route and service*

Description

Get all trip shapes for a given route and service

Usage

```
get_route_geometry(gtfs_sf_obj, route_ids = NULL, service_ids = NULL)
```

Arguments

gtfs_sf_obj	tidytransit gtfs object with sf data frames
route_ids	routes to extract
service_ids	service_ids to extract

Value

an sf dataframe for gtfs routes with a row/linestring for each trip

Examples

```
data(gtfs_duke)
gtfs_duke_sf <- gtfs_as_sf(gtfs_duke)
routes_sf <- get_route_geometry(gtfs_duke_sf)
plot(routes_sf[c(1,1350),])
```

get_stop_frequency *Get Stop Frequency*

Description

Calculate the number of departures and mean headways for all stops within a given timespan and for given service_ids.

Usage

```
get_stop_frequency(
  gtfs_obj,
  start_time = "06:00:00",
  end_time = "22:00:00",
  service_ids = NULL,
  by_route = TRUE
)
```

Arguments

gtfs_obj	a list of gtfs dataframes as read by read_gtfs().
start_time	analysis start time, can be given as "HH:MM:SS", hms object or numeric value in seconds.
end_time	analysis perdiod end time, can be given as "HH:MM:SS", hms object or numeric value in seconds.
service_ids	A set of service_ids from the calendar dataframe identifying a particular service id. If not provided, the service_id with the most departures is used.
by_route	Default TRUE, if FALSE then calculate headway for any line coming through the stop in the same direction on the same schedule.

Value

dataframe of stops with the number of departures and the headway (departures divided by timespan) in seconds as columns

Note

Some GTFS feeds contain a frequency data frame already. Consider using this instead, as it will be more accurate than what tidytransit calculates.

Examples

```
data(gtfs_duke)
stop_frequency <- get_stop_frequency(gtfs_duke)
x <- order(stop_frequency$mean_headway)
head(stop_frequency[x,])
```

---

get_trip_geometry *Get all trip shapes for given trip ids*

Description

Get all trip shapes for given trip ids

Usage

```
get_trip_geometry(gtfs_sf_obj, trip_ids)
```

Arguments

gtfs_sf_obj	tidytransit gtfs object with sf data frames
trip_ids	trip_ids to extract shapes

Value

an sf dataframe for gtfs routes with a row/linestring for each trip

Examples

```
data(gtfs_duke)
gtfs_duke <- gtfs_as_sf(gtfs_duke)
trips_sf <- get_trip_geometry(gtfs_duke, c("t_726295_b_19493_tn_41", "t_726295_b_19493_tn_40"))
plot(trips_sf[1,])
```

`gtfs_as_sf` *Convert stops and shapes to Simple Features*

Description

Stops are converted to POINT sf data frames. Shapes are created as LINESTRING data frame. Note that this function replaces stops and shapes tables in gtfs_obj.

Usage

```
gtfs_as_sf(gtfs_obj, skip_shapes = FALSE, crs = NULL, quiet = TRUE)
```

Arguments

`gtfs_obj`	a standard tidytransit gtfs object
`skip_shapes`	if TRUE, shapes are not converted. Default FALSE.
`crs`	optional coordinate reference system (used by sf::st_transform) to transform lon/lat coordinates of stops and shapes
`quiet`	boolean whether to print status messages

Value

tidygtfs object with stops and shapes as sf dataframes

See Also

`sf_as_tbl`

gtfs_duke *Example GTFS data*

Description

Data obtained from https://data.trilliumtransit.com/gtfs/duke-nc-us/duke-nc-us.zip.

Usage

```
gtfs_duke
```

Format

An object of class `tidygtfs` (inherits from `gtfs`) of length 25.

See Also

read_gtfs

gtfs_transform *Transform or convert coordinates of a gtfs feed*

Description

Transform or convert coordinates of a gtfs feed

Usage

```
gtfs_transform(gtfs_obj, crs)
```

Arguments

`gtfs_obj`	tidygtfs object
`crs`	target coordinate reference system, used by sf::st_transform

Value

tidygtfs object with transformed stops and shapes sf dataframes

na_to_empty_strings *Convert NA values to empty strings ("")*

Description

Convert NA values to empty strings ("")

Usage

```
na_to_empty_strings(gtfs_obj)
```

Arguments

gtfs_obj	tidygtfs object

plot.tidygtfs *Plot GTFS stops and trips*

Description

Plot GTFS stops and trips

Usage

```
## S3 method for class 'tidygtfs'
plot(x, ...)
```

Arguments

x	a gtfs_obj as read by read_gtfs()
...	further specifications

Value

plot

Examples

```
local_gtfs_path <- system.file("extdata",
                               "google_transit_nyc_subway.zip",
                               package = "tidytransit")
nyc <- read_gtfs(local_gtfs_path)
plot(nyc)
```

print.tidygtfs *Print a GTFS object*

Description

Prints a GTFS object suppressing the `class` attribute.

Usage

```
## S3 method for class 'tidygtfs'
print(x, ...)
```

Arguments

`x`	A GTFS object.
`...`	Optional arguments ultimately passed to `format`.

Value

The GTFS object that was printed, invisibly

Examples

```
 ## Not run:
path = system.file("extdata",
           "google_transit_nyc_subway.zip",
           package = "tidytransit")

g = read_gtfs(path)
print(g)

## End(Not run)
```

raptor *Calculate travel times from one stop to all reachable stops*

Description

`raptor` finds the minimal travel time, earliest or latest arrival time for all stops in `stop_times` with journeys departing from `stop_ids` within `time_range`.

Usage

```
raptor(
  stop_times,
  transfers,
  stop_ids,
  arrival = FALSE,
  time_range = 3600,
  max_transfers = NULL,
  keep = "all"
)
```

Arguments

stop_times	A (prepared) stop_times table from a gtfs feed. Prepared means that all stop time rows before the desired journey departure time should be removed. The table should also only include departures happening on one day. Use `filter_stop_times()` for easier preparation.
transfers	Transfers table from a gtfs feed. In general no preparation is needed.
stop_ids	Character vector with stop_ids from where journeys should start (or end)
arrival	If FALSE (default), all journeys *start* from `stop_ids`. If TRUE, all journeys *end* at `stop_ids`.
time_range	Departure or arrival time range in seconds. All departures from the first departure of stop_times (not necessarily from stop_id in `stop_ids`) within `time_range` are considered. If `arrival` is TRUE, all arrivals within `time_range` before the latest arrival time of stop_times are considered.
max_transfers	Maximum number of transfers allowed, no limit (NULL) as default.
keep	One of c("all", "shortest", "earliest", "latest"). By default, `all` journeys arriving at a stop are returned. With `shortest` the journey with shortest travel time is returned. With `earliest` the journey arriving at a stop the earliest is returned, `latest` works accordingly.

Details

With a modified Round-Based Public Transit Routing Algorithm (RAPTOR) using data.table, earliest arrival times for all stops are calculated. If two journeys arrive at the same time, the one with the later departure time and thus shorter travel time is kept. By default, all journeys departing within `time_range` that arrive at a stop are returned in a table. If you want all journeys *arriving* at stop_ids within the specified time range, set `arrival` to TRUE.

Journeys are defined by a "from" and "to" stop_id, a departure, arrival and travel time. Note that the exact journeys (with each intermediate stop and route ids for example) is *not* returned.

For most cases, `stop_times` needs to be filtered, as it should only contain trips happening on a single day and departures later than a given journey start time, see `filter_stop_times()`. The algorithm scans all trips until it exceeds `max_transfers` or all trips in `stop_times` have been visited.

Value

A data.table with journeys (departure, arrival and travel time) to/from all stop_ids reachable by stop_ids.

See Also

travel_times() for an easier access to travel time calculations via stop_names.

Examples

```
nyc_path <- system.file("extdata", "google_transit_nyc_subway.zip", package = "tidytransit")
nyc <- read_gtfs(nyc_path)

# you can use initial walk times to different stops in walking distance (arbitrary example values)
stop_ids_harlem_st <- c("301", "301N", "301S")
stop_ids_155_st <- c("A11", "A11N", "A11S", "D12", "D12N", "D12S")
walk_times <- data.frame(stop_id = c(stop_ids_harlem_st, stop_ids_155_st),
                         walk_time = c(rep(600, 3), rep(410, 6)), stringsAsFactors = FALSE)

# Use journeys departing after 7 AM with arrival time before 11 AM on 26th of June
stop_times <- filter_stop_times(nyc, "2018-06-26", 7*3600, 9*3600)

# calculate all journeys departing from Harlem St or 155 St between 7:00 and 7:30
rptr <- raptor(stop_times, nyc$transfers, walk_times$stop_id, time_range = 1800,
               keep = "all")

# add walk times to travel times
rptr <- merge(rptr, walk_times, by.x = "from_stop_id", by.y = "stop_id")
rptr$travel_time_incl_walk <- rptr$travel_time + rptr$walk_time

# get minimal travel times (with walk times) for all stop_ids
library(data.table)
shortest_travel_times <- setDT(rptr)[order(travel_time_incl_walk)][, .SD[1], by = "to_stop_id"]
hist(shortest_travel_times$travel_time, breaks = 360)
```

---

read_gtfs *Read and validate GTFS files*

Description

Reads GTFS text files from either a local .zip file or an URL and validates them against GTFS specifications.

Usage

```
read_gtfs(path, files = NULL, quiet = TRUE)
```

Arguments

path	The path to a GTFS .zip file.
files	A character vector containing the text files to be read from the GTFS (without the .txt extension). If NULL (the default) all existing files are read.
quiet	Whether to hide log messages and progress bars (defaults to TRUE).

Value

A tidygtfs object: a list of tibbles in which each entry represents a GTFS text file. Additional tables are stored in the . sublist.

See Also

validate_gtfs

Examples

```
local_gtfs_path <- system.file("extdata", "google_transit_nyc_subway.zip", package = "tidytransit")
gtfs <- read_gtfs(local_gtfs_path)
names(gtfs)

gtfs <- read_gtfs(local_gtfs_path, files = c("trips", "stop_times"))
names(gtfs)
```

---

route_type_names *Dataframe of route type id's and the names of the types (e.g. "Bus")*

Description

Extended GTFS Route Types: https://developers.google.com/transit/gtfs/reference/extended-route-types

Usage

```
route_type_names
```

Format

A data frame with 136 rows and 2 variables:

route_type the id of route type

route_type_name name of the gtfs route type

Source

https://gist.github.com/derhuerst/b0243339e22c310bee2386388151e11e

set_api_key *Set TransitFeeds API key for recall*

Description

Set TransitFeeds API key for recall

Usage

```
set_api_key()
```

Value

No value returned, function is used for setting environment variables

set_servicepattern *Calculate servicepattern ids for a gtfs feed*

Description

Each trip has a defined number of dates it runs on. This set of dates is called a service pattern in tidytransit. Trips with the same servicepattern id run on the same dates. In general, `service_id` can work this way but it is not enforced by the GTFS standard.

Usage

```
set_servicepattern(
  gtfs_obj,
  id_prefix = "s_",
  hash_algo = "md5",
  hash_length = 7
)
```

Arguments

`gtfs_obj`	tidytransit gtfs feed
`id_prefix`	all servicepattern id will start with this string
`hash_algo`	hashing algorithm used by digest
`hash_length`	length the hash should be cut to with substr(). Use -1 if the full hash should be used

Value

modified gtfs_obj with added servicepattern list and a table linking trips and pattern (trip_servicepatterns)

sf_as_tbl — *Convert stops and shapes from sf objects to tibbles*

Description

Coordinates are transformed to lon/lat

Usage

```
sf_as_tbl(gtfs_obj)
```

Arguments

gtfs_obj	tidygtfs object

Value

tidygtfs object with stops and shapes converted to tibbles

See Also

gtfs_as_sf

sf_lines_to_df — *Adds the coordinates of an sf LINESTRING object as columns and rows*

Description

Adds the coordinates of an sf LINESTRING object as columns and rows

Usage

```
sf_lines_to_df(
  lines_sf,
  coord_colnames = c("shape_pt_lon", "shape_pt_lat"),
  remove_geometry = TRUE
)
```

Arguments

lines_sf	sf object
coord_colnames	names of the new columns (existing columns are overwritten)
remove_geometry	remove sf geometry column?

sf_points_to_df *Adds the coordinates of an sf POINT object as columns*

Description

Adds the coordinates of an sf POINT object as columns

Usage

```
sf_points_to_df(
  pts_sf,
  coord_colnames = c("stop_lon", "stop_lat"),
  remove_geometry = TRUE
)
```

Arguments

pts_sf	sf object
coord_colnames	names of the new columns (existing columns are overwritten)
remove_geometry	remove sf geometry column?

shapes_as_sf *Convert shapes into Simple Features Linestrings*

Description

Convert shapes into Simple Features Linestrings

Usage

```
shapes_as_sf(gtfs_shapes, crs = NULL)
```

Arguments

gtfs_shapes	a gtfs$shapes dataframe
crs	optional coordinate reference system (used by sf::st_transform) to transform lon/lat coordinates

Value

an sf dataframe for gtfs shapes

stops_as_sf *Convert stops into Simple Features Points*

Description

Convert stops into Simple Features Points

Usage

```
stops_as_sf(stops, crs = NULL)
```

Arguments

stops	a gtfs$stops dataframe
crs	optional coordinate reference system (used by sf::st_transform) to transform lon/lat coordinates

Value

an sf dataframe for gtfs routes with a point column

Examples

```
data(gtfs_duke)
some_stops <- gtfs_duke$stops[sample(nrow(gtfs_duke$stops), 40),]
some_stops_sf <- stops_as_sf(some_stops)
plot(some_stops_sf)
```

stop_distances *Calculate distances between a given set of stops*

Description

Calculate distances between a given set of stops

Usage

```
stop_distances(gtfs_stops)
```

Arguments

gtfs_stops	gtfs stops table either as data frame (with at least stop_id, stop_lon and stop_lat columns) or as sf object.

Value

Returns a data.frame with each row containing a pair of stop_ids (columns `from_stop_id` and `to_stop_id`) and the `distance` between them (in meters)

Note

The resulting data.frame has nrow(gtfs_stops)^2 rows, distances calculations among all stops for large feeds should be avoided

Examples

```
library(dplyr)

nyc_path <- system.file("extdata", "google_transit_nyc_subway.zip", package = "tidytransit")
nyc <- read_gtfs(nyc_path)

nyc$stops %>%
  filter(stop_name == "Borough Hall") %>%
  stop_distances() %>%
  arrange(desc(distance))

#> # A tibble: 36 × 3
#>    from_stop_id to_stop_id  distance
#>    <chr>        <chr>          <dbl>
#>  1 423          232             91.5
#>  2 423N         232             91.5
#>  3 423S         232             91.5
#>  4 423          232N            91.5
#>  5 423N         232N            91.5
#>  6 423S         232N            91.5
#>  7 423          232S            91.5
#>  8 423N         232S            91.5
#>  9 423S         232S            91.5
#> 10 232          423             91.5
#> # . . .  with 26 more rows
```

---

stop_group_distances *Calculates distances among stop within the same group column*

Description

By default calculates distances among stop_ids with the same stop_name.

Usage

```
stop_group_distances(gtfs_stops, by = "stop_name")
```

Arguments

gtfs_stops	gtfs stops table either as data frame (with at least stop_id, stop_lon and stop_lat columns) or as sf object.
by	group column, default: stop_name

Value

data.frame with one row per group containing a distance matrix (distances), number of stop ids within that group (n_stop_ids) and distance summary values (dist_mean, dist_median and dist_max).

Examples

```
library(dplyr)

nyc_path <- system.file("extdata", "google_transit_nyc_subway.zip", package = "tidytransit")
nyc <- read_gtfs(nyc_path)

stop_group_distances(nyc$stops)
#> # A tibble: 380 × 6
#>    stop_name   distances       n_stop_ids dist_mean dist_median dist_max
#>    <chr>       <list>              <dbl>     <dbl>       <dbl>    <dbl>
#>  1 86 St       <dbl [18 × 18]>         18     5395.       5395.   21811.
#>  2 79 St       <dbl [6 × 6]>            6    19053.      19053.   19053.
#>  3 Prospect Av <dbl [6 × 6]>            6    18804.      18804.   18804.
#>  4 77 St       <dbl [6 × 6]>            6    16947.      16947.   16947.
#>  5 59 St       <dbl [6 × 6]>            6    14130.      14130.   14130.
#>  6 50 St       <dbl [9 × 9]>            9     7097.       7097.   14068.
#>  7 36 St       <dbl [6 × 6]>            6    12496.      12496.   12496.
#>  8 8 Av        <dbl [6 × 6]>            6    11682.      11682.   11682.
#>  9 7 Av        <dbl [9 × 9]>            9     5479.       5479.   10753.
#> 10 111 St      <dbl [9 × 9]>            9     3877.       3877.    7753.
#> # . . .  with 370 more rows
```

---

summary.tidygtfs *GTFS feed summary*

Description

GTFS feed summary

Usage

```
## S3 method for class 'tidygtfs'
summary(object, ...)
```

Arguments

object	a gtfs_obj as read by read_gtfs()
...	further specifications

Value

the tidygtfs object, invisibly

---

travel_times *Calculate shortest travel times from a stop to all reachable stops*

Description

Function to calculate the shortest travel times from a stop (given by stop_name) to all other stop_names of a feed. filtered_stop_times needs to be created before with filter_stop_times() or filter_feed_by_date().

Usage

```
travel_times(
  filtered_stop_times,
  stop_name,
  time_range = 3600,
  arrival = FALSE,
  max_transfers = NULL,
  max_departure_time = NULL,
  return_coords = FALSE,
  return_DT = FALSE,
  stop_dist_check = 300
)
```

Arguments

filtered_stop_times	stop_times data.table (with transfers and stops tables as attributes) created with filter_stop_times() where the departure or arrival time has been set. Alternatively, a filtered feed created by filter_feed_by_date() can be used.
stop_name	Stop name for which travel times should be calculated. A vector with multiple names is accepted.
time_range	All departures within this range in seconds after the first departure of filtered_stop_times are considered for journeys. If arrival is TRUE, all journeys arriving within time range before the latest arrival of filtered_stop_times are considered.
arrival	If FALSE (default), all journeys *start* from stop_name. If TRUE, all journeys *end* at stop_name.
max_transfers	The maximimum number of transfers

max_departure_time
: Either set this parameter or time_range. Only departures before max_departure_time are used. Accepts "HH:MM:SS" or seconds as a numerical value. Unused if arrival is TRUE.

return_coords
: Returns stop coordinates as columms. Default is FALSE.

return_DT
: travel_times() returns a data.table if TRUE. Default is FALSE which returns a tibble/tbl_df.

stop_dist_check
: stop_names are not structured identifiers like stop_ids or parent_stations, so it's possible that stops with the same name are far apart. travel_times() errors if the distance among stop_ids with the same name is above this threshold (in meters). Use FALSE to turn check off. However, it is recommended to either use raptor() or fix the feed (see cluster_stops()).

Details

This function allows easier access to raptor() by using stop names instead of ids and returning shortest travel times by default.

Note however that stop_name might not be a suitable identifier for a feed. It is possible that multiple stops have the same name while not being related or geographically close to each other. stop_group_distances() and cluster_stops() can help identify and fix issues with stop_names.

Value

A table with travel times to/from all stops reachable by stop_name and their corresponding journey departure and arrival times.

Examples

```
nyc_path <- system.file("extdata", "google_transit_nyc_subway.zip", package = "tidytransit")
nyc <- read_gtfs(nyc_path)

# stop_names in this feed are not restricted to an area, create clusters of stops to fix
nyc <- cluster_stops(nyc, group_col = "stop_name", cluster_colname = "stop_name")

# Use journeys departing after 7 AM with arrival time before 9 AM on 26th June
stop_times <- filter_stop_times(nyc, "2018-06-26", 7*3600, 9*3600)

tts <- travel_times(stop_times, "34 St - Herald Sq", return_coords = TRUE)
library(dplyr)
tts <- tts %>% filter(travel_time <= 3600)

# travel time to Queensboro Plaza is 810 seconds, 13:30 minutes
tts %>% filter(to_stop_name == "Queensboro Plaza") %>% pull(travel_time) %>% hms::hms()

# plot a simple map showing travel times to all reachable stops
# this can be expanded to isochron maps
library(ggplot2)
ggplot(tts) + geom_point(aes(x=to_stop_lon, y=to_stop_lat, color = travel_time))
```

validate_gtfs *Validate GTFS file*

Description

Validates the GTFS object against GTFS specifications and raises warnings if required files/fields are not found. This function is called in `read_gtfs`.

Usage

```
validate_gtfs(gtfs_obj, files = NULL, quiet = TRUE, warnings = TRUE)
```

Arguments

`gtfs_obj`	A GTFS object
`files`	A character vector containing the text files to be validated against the GTFS specification (without the `.txt` extension). If `NULL` (the default) the provided GTFS is validated against all possible GTFS text files.
`quiet`	Whether to hide log messages (defaults to TRUE).
`warnings`	Whether to display warning messages (defaults to TRUE).

Value

A tidygtfs with a `validation_result` attribute. This attribute is a `tibble` containing the validation summary of all possible fields from the specified files.

Details

GTFS object's files and fields are validated against the GTFS specifications as documented in Google's Static GTFS Reference:

- GTFS feeds are considered valid if they include all required files and fields. If a required file/field is missing the function (optionally) raises a warning.
- Optional files/fields are listed in the reference above but are not required, thus no warning is raised if they are missing.
- Extra files/fields are those who are not listed in the reference above (either because they refer to a specific GTFS extension or due to any other reason).

Note that some files (`calendar.txt`, `calendar_dates.txt` and `feed_info.txt`) are conditionally required. This means that:

- `calendar.txt` is initially set as a required file. If it's not present, however, it becomes optional and `calendar_dates.txt` (originally set as optional) becomes required.
- `feed_info.txt` is initially set as an optional file. If `translations.txt` is present, however, it becomes required.

Examples

```
local_gtfs_path <- system.file("extdata", "google_transit_nyc_subway.zip", package = "tidytransit")
gtfs <- read_gtfs(local_gtfs_path)
attr(gtfs, "validation_result")

gtfs$shapes <- NULL
validation_result <- validate_gtfs(gtfs)

# should raise a warning
gtfs$stop_times <- NULL
validation_result <- validate_gtfs(gtfs)
```

`write_gtfs` *Write a tidygtfs object to a zip file*

Description

Write a tidygtfs object to a zip file

Usage

```
write_gtfs(gtfs_obj, zipfile, compression_level = 9, as_dir = FALSE)
```

Arguments

`gtfs_obj`	a tidygtfs object
`zipfile`	path to the zip file the feed should be written to
`compression_level`	a number between 1 and 9.9, passed to zip::zip
`as_dir`	if TRUE, the feed is not zipped and zipfile is used as a directory path. Files within the directory will be overwritten.

Value

Invisibly returns gtfs_obj

Note

Auxilliary tidytransit tables (e.g. `dates_services`) are not exported.
