# Package 'wdm' 

## March 17, 2022

Title Weighted Dependence Measures
Version 0.2.3
Description Provides efficient implementations of weighted dependence measures and related asymptotic tests for independence. Implemented measures are the Pearson correlation, Spearman's rho, Kendall's tau, Blomqvist's beta, and Hoeffding's D; see, e.g., Nelsen (2006) [doi:10.1007/0-387-28678-0](doi:10.1007/0-387-28678-0) and Hollander et al. (2015, ISBN:9780470387375).

wdm-package Weighted Dependence Measures
```

## Description

Provides efficient implementations of weighted dependence measures and related asymptotic tests for independence. Implemented measures are the Pearson correlation, Spearman's rho, Kendall's tau, Blomqvist's beta, and Hoeffding's D; see, e.g., Nelsen (2006) [doi:10.1007/0-387-28678-0](doi:10.1007/0-387-28678-0) and Hollander et al. (2015, ISBN:9780470387375).

## Details

The DESCRIPTION file: This package was not yet installed at build time.
indep_test Independence Tests for Weighted Dependence Measures

## Description

Computes a (possibly weighted) dependence measure between $x$ and $y$ if these are vectors. If $x$ and $y$ are matrices then the measure between the columns of $x$ and the columns of $y$ are computed.

## Usage

indep_test(
x ,
$y$,
method = "pearson",
weights = NULL,
remove_missing = TRUE, alternative = "two-sided"
)

## Arguments

$x, y \quad$ numeric vectors of data values. $x$ and $y$ must have the same length.
method the dependence measure; see Details for possible values.
weights an optional vector of weights for the observations.
remove_missing if TRUE, all (pairswise) incomplete observations are removed; if FALSE, the function throws an error if there are incomplete observations.
alternative indicates the alternative hypothesis and must be one of "two-sided", "greater" or "less". You can specify just the initial letter. "greater" corresponds to positive association, "less" to negative association.
$w d m$

## Details

Available methods:

- "pearson": Pearson correlation
- "spearman": Spearman's $\rho$
- "kendall": Kendall's $\tau$
- "blomqvist": Blomqvist's $\beta$
- "hoeffding": Hoeffding's $D$

Partial matching of method names is enabled. All methods except "hoeffding" work with discrete variables.

## Examples

```
x <- rnorm(100)
y <- rpois(100, 1) # all but Hoeffding's D can handle ties
w <- runif(100)
indep_test(x, y, method = "kendall") # unweighted
indep_test(x, y, method = "kendall", weights = w) # weighted
```

    wdm Weighted Dependence Measures
    
## Description

Computes a (possibly weighted) dependence measure between $x$ and $y$ if these are vectors. If $x$ and $y$ are matrices then the measure between the columns of $x$ and the columns of $y$ are computed.

## Usage

wdm(x, y = NULL, method = "pearson", weights = NULL, remove_missing = TRUE)

## Arguments

$x \quad$ a numeric vector, matrix or data frame.
$y \quad$ NULL (default) or a vector, matrix or data frame with compatible dimensions to $x$. The default is equivalent to ' $\mathrm{y}=\mathrm{x}$ " (but more efficient).
method the dependence measure; see Details for possible values.
weights an optional vector of weights for the observations.
remove_missing if TRUE, all (pairswise) incomplete observations are removed; if FALSE, the function throws an error if there are incomplete observations.

## Details

Available methods:

- "pearson": Pearson correlation
- "spearman": Spearman’s $\rho$
- "kendall": Kendall's $\tau$
- "blomqvist": Blomqvist's $\beta$
- "hoeffding": Hoeffding's $D$ Partial matching of method names is enabled.

Spearman's $\rho$ and Kendall's $\tau$ are corrected for ties if there are any.

## Examples

```
## dependence between two vectors
x <- rnorm(100)
y <- rpois(100, 1) # all but Hoeffding's D can handle ties
w <- runif(100)
wdm(x, y, method = "kendall") # unweighted
wdm(x, y, method = "kendall", weights = w) # weighted
## dependence in a matrix
x <- matrix(rnorm(100 * 3), 100, 3)
wdm(x, method = "spearman") # unweighted
wdm(x, method = "spearman", weights = w) # weighted
## dependence between columns of two matrices
y <- matrix(rnorm(100 * 2), 100, 2)
wdm(x, y, method = "hoeffding") # unweighted
wdm(x, y, method = "hoeffding", weights = w) # weighted
```
